

Abstract: This tutorial is concerned with emerging issues in applying Model-Based Systems Engineering (MBSE), in two categories, and is divided into two half-day sessions:

- **Part I (Morning):** Planning and Assessing Your Path to Value from MBSE--
 - In its earliest years, MBSE enthusiasm has been focused on technical model content and methodology, tools, languages, and standards. As MBSE reaches for mainstream use, larger groups of non-technical stakeholders are involved, and larger questions of strategy and paths forward for propagation appear. This tutorial session will address key developments emerging from efforts toward standardization and transformation, being pursued in two professional societies in particular (ASME and INCOSE). In Part I, attendees will learn how to apply the planning framework, and take a copy home to use. Attendees will also learn about introducing re-usable MBSE Patterns into work processes, and learn how to get started addressing model credibility issues.
- **Part II (Afternoon):** Applying MBSE Patterns for Increased Leverage: Examples from Smart Manufacturing and the Internet of Things (IoT)--
 - Models are interesting to construct, and modelers are enthusiastic to do so. However, the business case for originating a “clean sheet” model for each project grows weaker as systems become more complex, as more is at stake, and as the demands for model content and credibility grow. This tutorial session will address the use of MBSE Patterns—formal models that are configurable and re-usable for different projects—as pursued in recent years by the INCOSE MBSE Patterns Working Group. In Part II, attendees will learn about the Embedded Intelligence Pattern and the Smart Manufacturing Pattern. Attendees will also learn about the strategy of financial capitalization of MBSE Patterns.

Introduction of Tutorial Participants

Thanks to Harry Potter.

11th Annual INCOSE
Great Lakes Regional Conference

**SUPERIOR SYSTEM SOLUTIONS FOR
TODAY'S COMPLEX ENVIRONMENTS**

11 - 14 October 2017
Twin Cities, Minnesota

Tutorial Summary Outline

Part I (Morning):

- **Targeting Purpose**: Planning development, use, and life cycle of models based on a standard model planning framework, neutral as to modeling tools, languages, methods
- **Institutionalizing Learning**: Practical steps to improve on organizational learning, using models as a focus of organizational learning and knowledge, based on model-based Learning Systems and Autonomous Systems.
- **Enabling Trust**: Can You Trust Someone Else's Model? Your Model? Planning for Model Verification, Validation, and Uncertainty Quantification (VVUQ)

Part II (Afternoon):

- **Representing Intelligence**: The Embedded Intelligence (EI) Pattern, for any embedding of intelligence, in the form of automation, human operators, or other systems of management, feedback, regulation.
- **Advancing Production**: The Smart Manufacturing Pattern, for the IoT Age, for any manufacturing process, and with varied forms of instrumentation and management.
- **Capitalizing IP** of MBSE Patterns as Financial Assets, to shift the burden of model cost to the time of model use and benefit.

Enthusiasm for Models

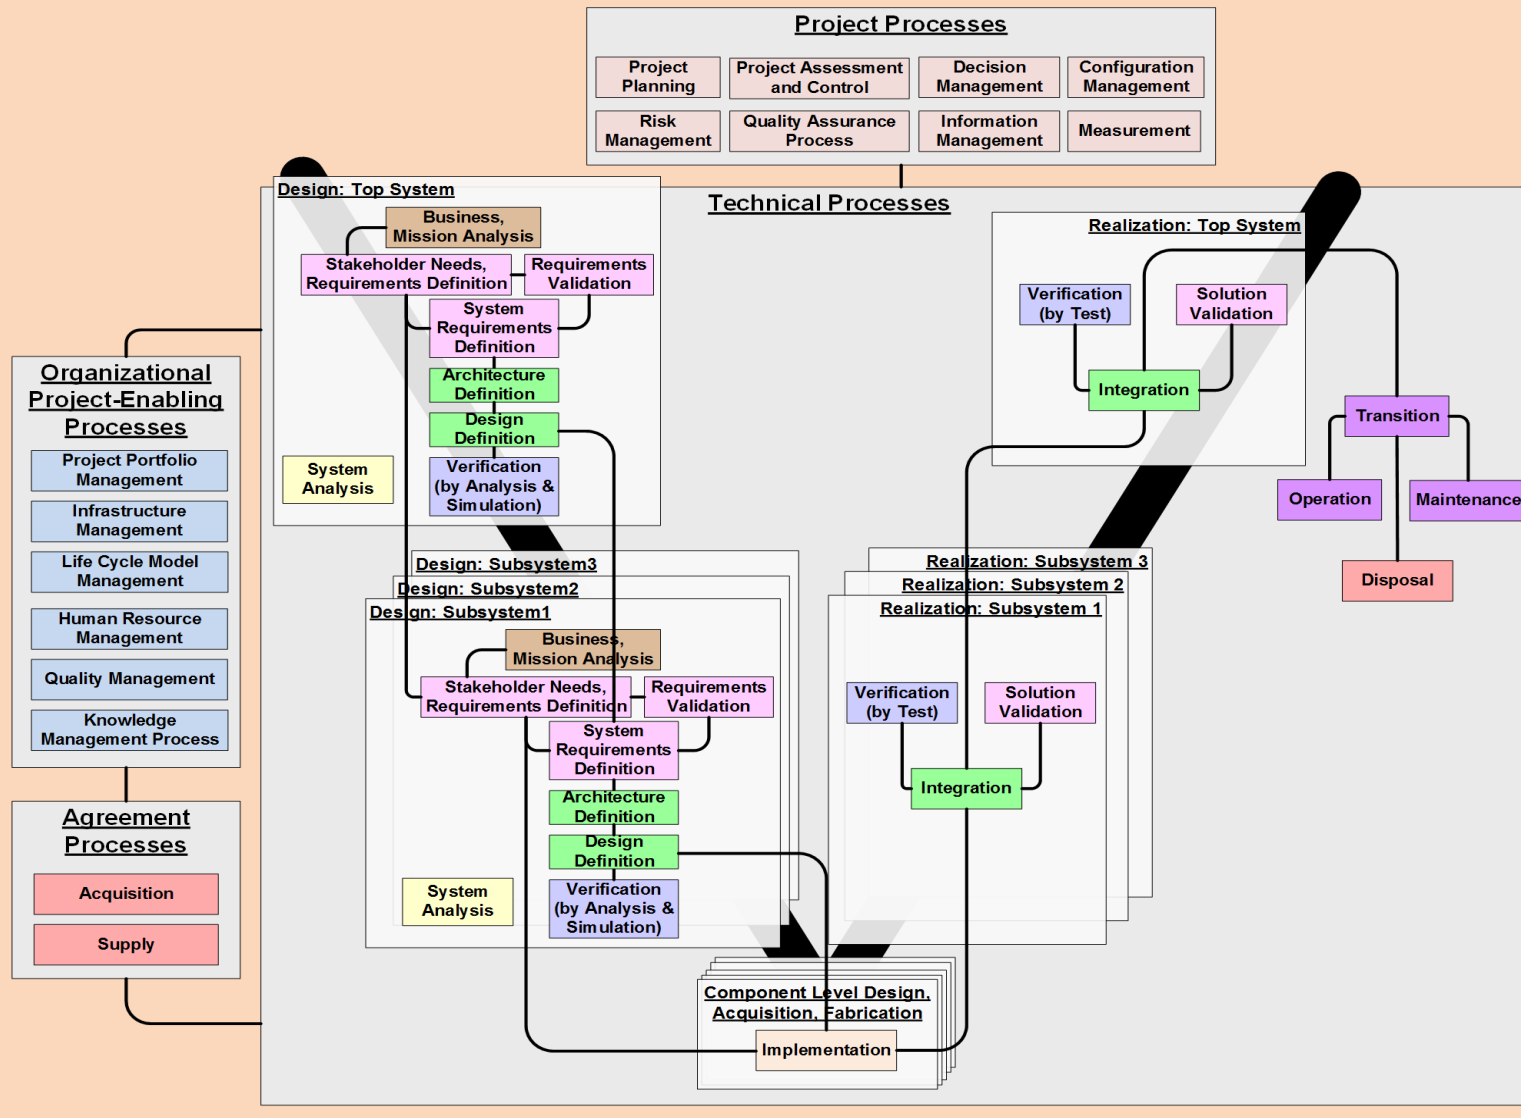

The INCOSE systems community has shown growing enthusiasm for “engineering with models” of all sorts:

- Historical tradition of math-physics engineering models
- A World in Motion: INCOSE Vision 2025
- Growth of the INCOSE IW MBSE Workshop
- Growth in systems engineers in modeling classes
- INCOSE Board of Directors’ objective to accelerate transformation of SE to a model-based discipline
- Joint INCOSE activities with NAFEMS

Models for what purposes? Possible ISO15288 answers.

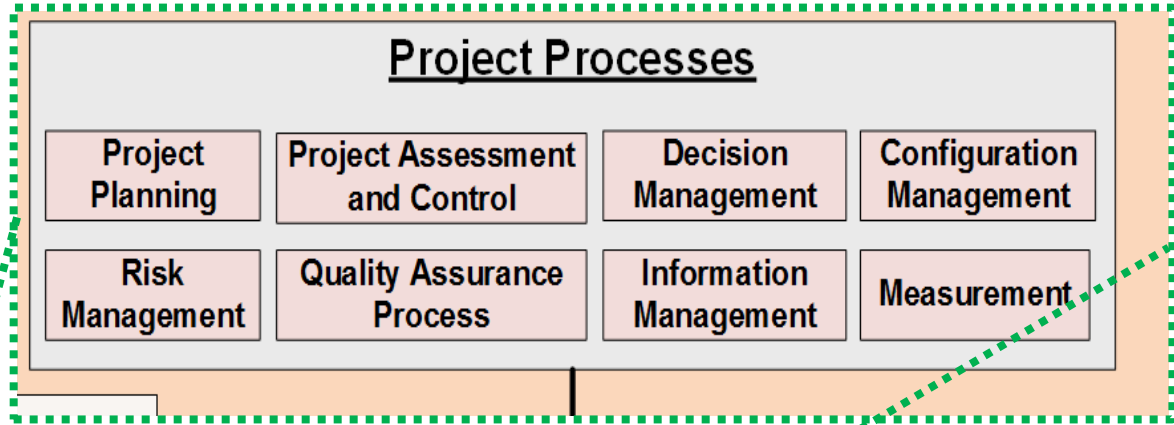

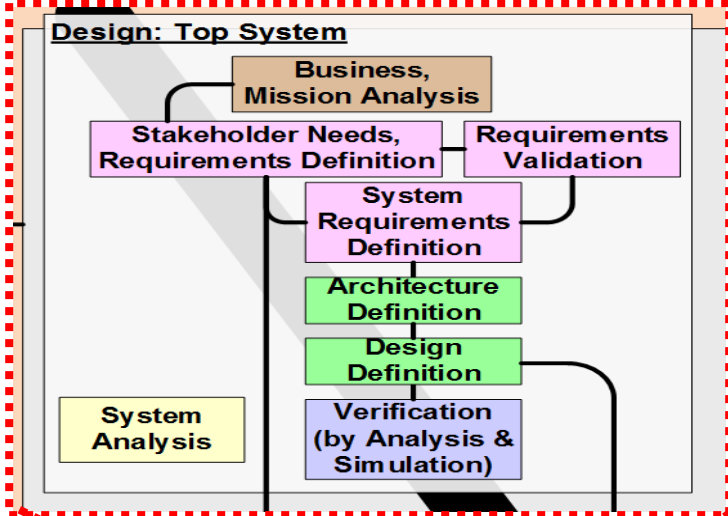

System of Innovation (SOI) Pattern Logical Architecture

(Adapted from ISO/IEC 15288:2015)

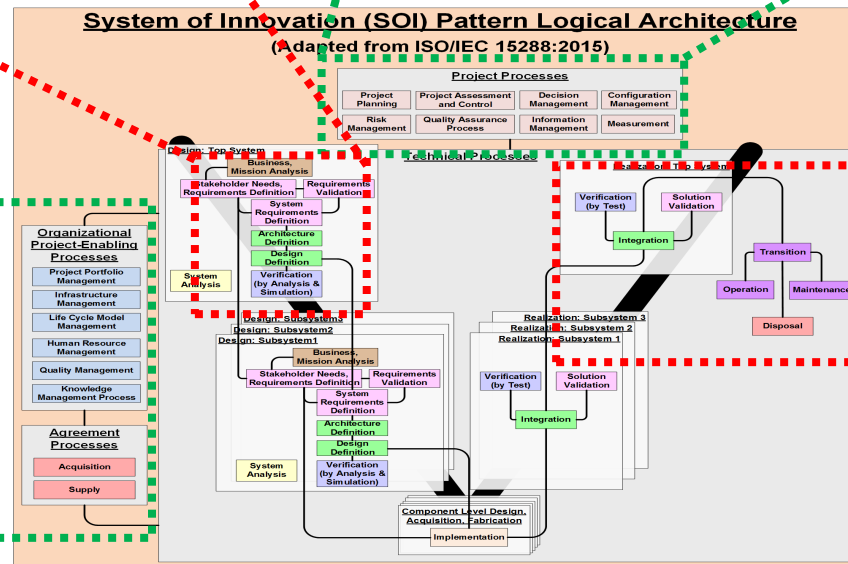

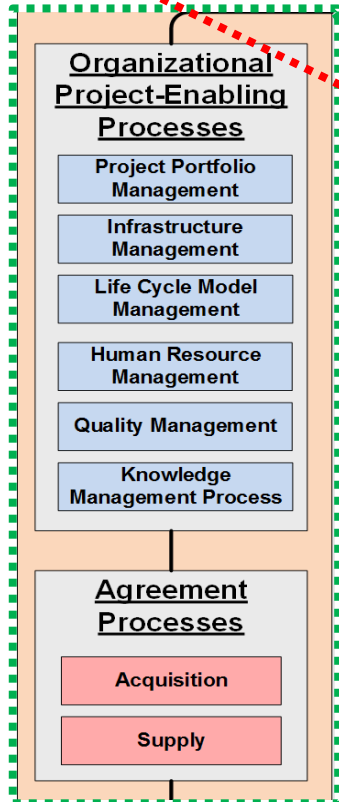

Potentially for any ISO 15288 processes:

- If there is a net benefit . . .
- Some more obvious than others.
- The INCOSE MB Transformation is using ISO 15288 framework as an aid to migration planning and assessment.

Many potential purposes for models

Targeting Purpose: Connections to ISO15288

- Model-based methods have multiple connections to ISO15288 system life cycle management practices:
 - The INCOSE Model-Based Transformation project provides means for assessing and planning the migration of ISO15288 practices to model-based approaches.
 - The INCOSE Agile SE Life Cycle Management Discovery Project provides inputs to a future version of ISO15288 including agile SE, and includes the model-based ASELCM Pattern and its representation of the roles of models in innovation.
 - The INCOSE MBSE Patterns Working Group supports improving the leverage of model-based practices using formal S*Patterns, and is partnering with ASME toward standards for the verification and validation of computational models for ISO15288 purposes.
- This tutorial will summarize how these efforts are being fit together to provide usable practitioner value, and how to get involved.

Targeting Purpose: Connections to ISO15288

- Maturity in MBSE is not only about our models, methods, and tools--although it includes them:
 - What will we use models for (intended purpose)? Who is “we”?
 - How do we go about trusting our model?
 - Is our learning effectively enhanced?
- State of art & practice in some of these areas still low:
 - So, expect significant continuing change.
 - Measuring against current base may not reflect “maturity”.
- There are overall requirements we can use to measure our MBSE maturity:
 - Based on, but enlarging, the interpretation of ISO 15288, existing maturity models, and computational models.
 - Providing a foundation for future maturity assessment, planning.
- The emerging foundation opens up thinking about scope of impacts, and therefore scope of maturity assessment.

INCOSE MB Transformation; planning and assessment

- One way to stay focused pragmatically is to be very clear about explicit purposes for models.
- Because ISO 15288 offers a (relatively) well-known and accessible reference model for the life cycle management of systems, it provides a convenient “menu” listing of potential high level purposes of models in the life cycle of systems.
- The INCOSE Model-Based Transformation team is using this as the basis of an MBSE migration and maturation planning and assessment instrument . . .

INCOSE MB Transformation; Planning and Assessment Instrument

The INCOSE MBSE Transformation products are based on identification of --

Stakeholders in the MBSE Transformation:

1. Model Consumers (Model Users);
2. Model Creators (including Model Improvers);
3. Complex Idea Communicators (Model "Distributors");
4. Model Infrastructure Providers, Including Tooling, Language and Other Standards, Methods;
5. INCOSE and other Engineering Professional Societies.

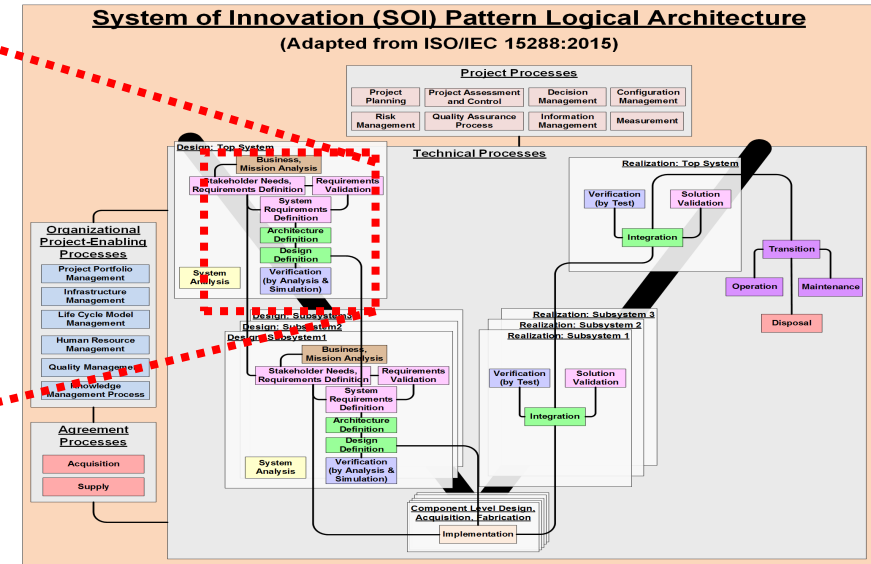

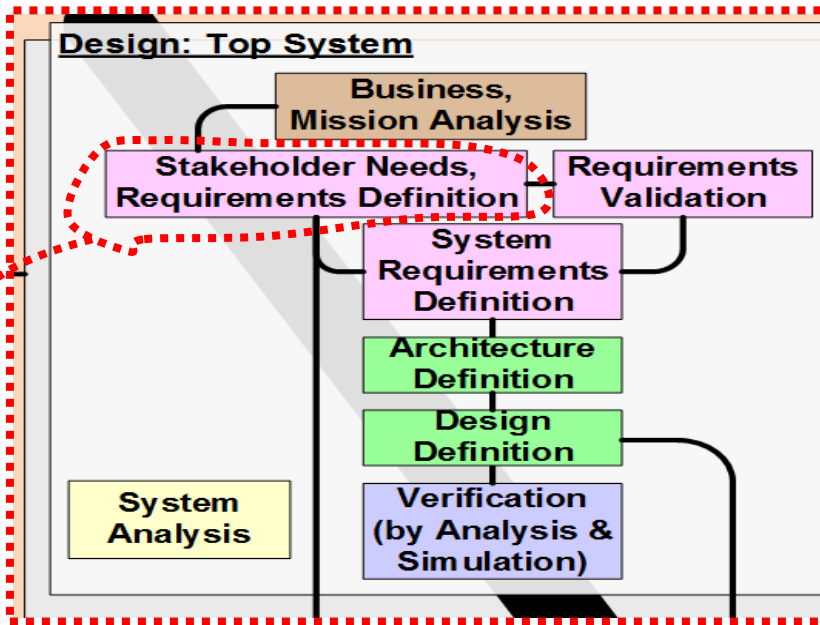

Notice that group (1) is by far the largest population of stakeholders, for future MBSE impact potential.

Further analysis of the Transformation Stakeholders

(also shows Energy Tech 2016 Conference ratings of needs, opportunities)

| Population ←-- Size (Log) | Stakeholders in A Successful MBSE Transformation (showing their related roles and parent organizations) | | | | | | |
|--|---|-------------------------------|--|---|--------------------------|--|----|
| | | Industry & Govmt. Initiatives | Organizations Internalizing MBSE, Including Govmt Contractors & Commercial | Vendors of MBSE Tooling and Services | Academia and Researchers | Technical Societies, Other Non- Technical Organizations | |
| Model Consumers (Model Users): | | | | | | | |
| **** | Non-technical stakeholders in various Systems of Interest, who acquire / make decisions about / make use of those systems, and are informed by models of them. This includes mass market consumers, policy makers, business and other leaders, investors, product users, voters in public or private elections or selection decisions, etc. | X | X | | | X | |
| ** | Technical model users, including designers, project leads, production engineers, system installers, maintainers, and users/operators. | X | X | | | X | |
| * | Leaders responsible to building their organization's MBSE capabilities and enabling MBSE on their projects | X | X | | | X | |
| Model Creators (including Model Improvers): | | | | | | | |
| * | Product visionaries, marketers, and other non-technical leaders of thought and organizations | X | X | | X | X | |
| * | System technical specifiers, designers, testers, theoreticians, analysts, scientists | X | X | | X | X | |
| * | Students (in school and otherwise) learning to describe and understand systems | | | | X | X | |
| * | Educators, teaching the next generation how to create with models | X | X | | X | | |
| * | Researchers who advance the practice | | X | X | X | | |
| * | Those who translate information originated by others into models | X | X | | X | X | |
| * | Those who manage the life cycle of models | X | X | | X | X | |
| Complex Idea Communicators (Model "Distributors"): | | | | | | | |
| ** | Marketing professionals | X | X | X | | X | |
| ** | Educators, especially in complex systems areas of engineering and science, public policy, other domains, and including curriculum developers as well as teachers | X | X | X | X | | |
| ** | Leaders of all kinds | X | X | X | X | X | |
| Model Infrastructure Providers, Including Tooling, Language and Other Standards, Methods: | | | | | | | |
| * | Suppliers of modeling tools and other information systems and technologies that house or make use of model-based information | | | X | | | |
| * | Methodologists, consultants, others who assist individuals and organizations in being more successful through model-based methods | X | X | X | X | | |
| * | Standards bodies (including those who establish modeling standards as well as others who apply them within other standards) | X | | | | X | |
| INCOSE and other Engineering Professional Societies | | | | | | | |
| * | As a deliverer of value to its membership | | | | | X | |
| * | As seen by other technical societies and by potential members | | | | | X | |
| * | As a great organization to be a part of | | | | | X | |
| * | As promoter of advance and practice of systems engineering and MBSE | | | | | X | 12 |

Each 15288 process definition suggests potentially assessable model impacts

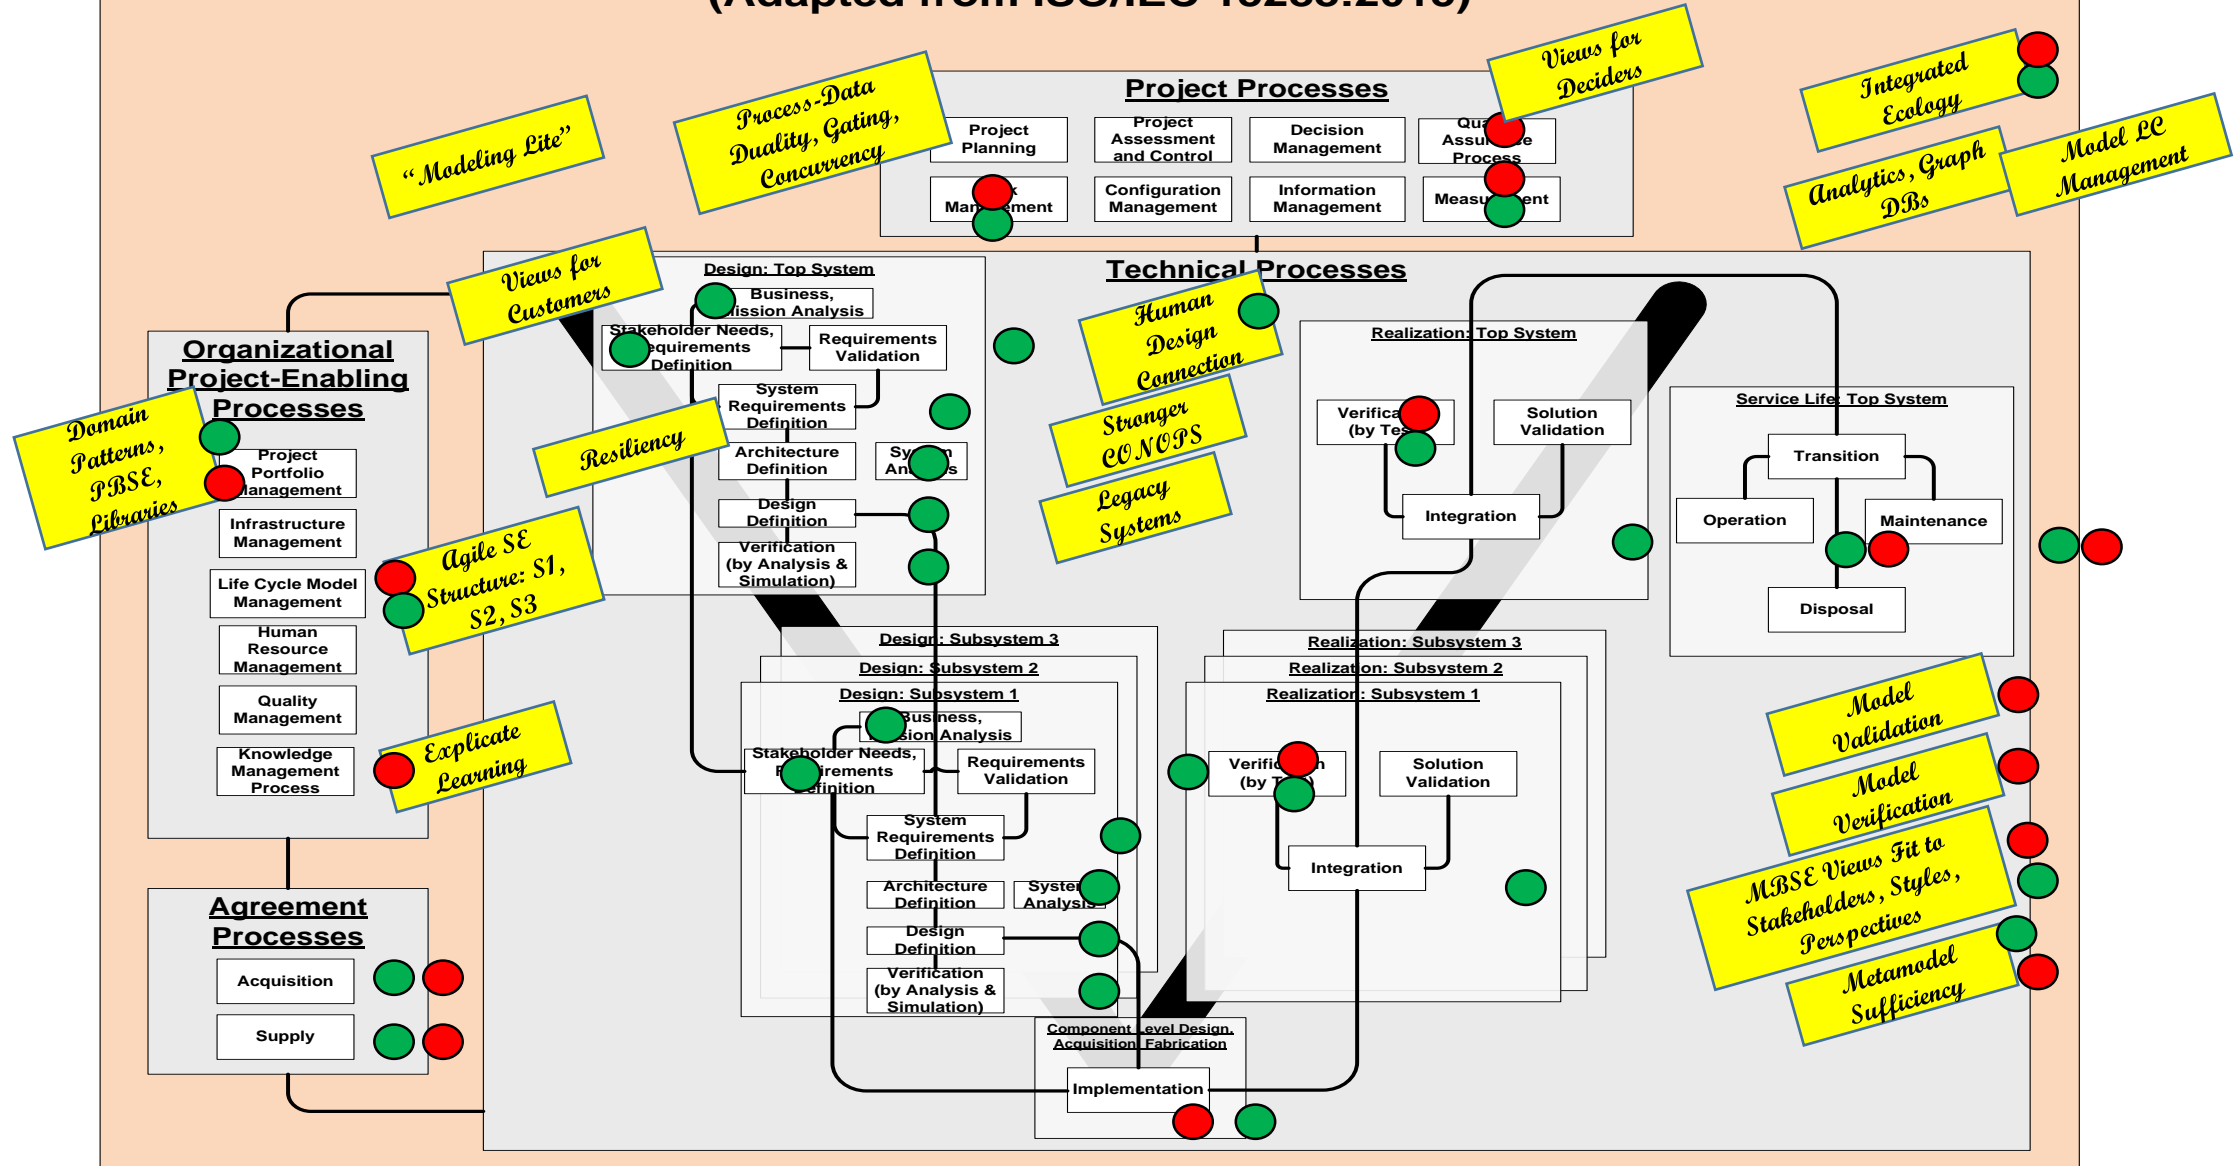

- “Stakeholders of the system are identified.
- Required characteristics and context of use of capabilities and concepts in the life cycle stages, including operational concepts, are defined.
- Constraints on a system are identified.
- Stakeholder needs are defined.
- Stakeholder needs are prioritized and transformed into clearly defined stakeholder requirements.
- Critical performance measures are defined.
- Stakeholder agreement that their needs and expectations are reflected adequately in the requirements is achieved.
- Any enabling systems or services needed for stakeholder needs and requirements are available.
- Traceability of stakeholder requirements to stakeholders and their needs is established.”

Each ISO15288 process offers higher level targeting, assessment
 (Example: Energy Tech 2016 Feedback on MBSE in ISO15288)

System of Innovation (SOI) Pattern Logical Architecture

(Adapted from ISO/IEC 15288:2015)

Sufficiency for Purposes; Minimality

- Systems of Modeling, practiced, must be sufficient for their intended purposes, and preferably minimal / not overly complex, proliferated:
 - A lot of (continuing) effort by the modeling community being invested in sufficiency and also minimality.
 - Understanding of what is needed improving, but lists of future capabilities are long.
- More is involved than modeling languages, tools, methods, alone; for example:
 - Fitness to non-technical users and uses
 - Strong enough conceptual foundation, based on STEM, not just information models.
 - Credibility of model content (trust in the model)

What Is the Smallest Model of a System?

Abstract. How we represent systems is fundamental to the history of mathematics, science, and engineering. Model-based engineering methods shift the nature of representation of systems from historical prose forms to explicit data structures more directly comparable to those of science and mathematics. However, using models does not guarantee simpler representation--indeed a typical fear voiced about models is that they may be too complex.

Minimality of system representations is of both theoretical and practical interest. The mathematical and scientific interest is that the size of a system's "minimal representation" is one definition of its complexity. The practical engineering interest is that the size and redundancy of engineering specifications challenge the effectiveness of systems engineering processes. INCOSE thought leaders have asked how systems work can be made 10:1 simpler to attract a 10:1 larger global community of practitioners. And so, we ask: What is the smallest model of a system?

**Systems of Innovation II:
The Emergence of Purpose**

William D. Schindel
ICTT System Sciences
schindel@icctt.com

Abstract. Engineers design mindful of the purpose of a system. So, engineering conceptual definitions of the concept of "system" frequently include the idea of purpose.

However, we also use "system" to describe things not human-designed. We might refer to purpose in living systems, as in the immune system, but biologists use "function" to avoid this. What about inanimate natural systems? Do Saturn's rings have a purpose, or function? And what about pathologies, when systems don't work as they "should"? Do all these "systems" terms and concepts serve us well across these different domains, or are some force-fit?

Using the language of Model-Based Systems Engineering (MBSE) and Pattern-Based Systems Engineering (PBSE), this paper describes a framework in which "system" and "purpose" emerge at different levels, apply uniformly, naturally, or not at all, and inform the framework

Abstract. Traditional systems engineering pays attention to careful composition of prose requirements statements. Even so, prose appears less than what is needed to advance the art of systems engineering into a theoretically-based engineering discipline comparable to Electrical, Mechanical, or Chemical Engineering. Ask three people to read a set of prose requirements statements, and a universal experience is that there will be three different impressions of their meaning. The rise of Model-Based Systems Engineering might suggest the demise of prose requirements, but we argue otherwise. This paper shows how prose requirements can be productively embedded in and a valued formal part of requirements models. This leads to the practice-impacting insight that requirements statements can be non-linear extensions of linear transfer functions, shows how their ambiguity can be further reduced using ordinary language, how their completeness or overlap more easily audited, and how they can be "understood" more completely by engineering tools.

**Failure Analysis: Insights from
Model-Based Systems Engineering**

William D. Schindel

Abstract. Processes for system failure analysis (e.g., FMEA) are structured, well-documented, and supported by tools. Nevertheless, we hear complaints that FMEA work feels (1) too labor intensive to encourage engagement, (2) somewhat arbitrary in identifying issues, (3) overly sensitive to the skills and background of the performing team, and (4) not building enough confidence of fully identifying the risks of system failure. In fairness to experts in the process, perhaps such complaints come from those less experienced—but even so, we should care how to describe this process to encourage better technical and experience outcomes. This paper shows how Model-Based Systems Engineering (MBSE) answers these challenges by deeper and novel integration with requirements and design. Just as MBSE powered the requirements discovery process past its earlier, more subjective performance, so also can MBSE accelerate understanding and performance of failure risk analysis--as a discipline deeply connected within the SE process.

**Got Phenomena? Science-Based Disciplines for
Emerging Systems Challenges**

Bill Schindel
ICTT System Sciences
schindel@icctt.com

Abstract. Engineering disciplines (ME, EE, CE, ChE) sometimes argue their fields have "real physical phenomena", "hard science" based laws, and first principles, claiming Systems Engineering lacks equivalent phenomenological foundation. We argue the opposite, and how replanting systems engineering in MBSE/PBSE supports emergence of new hard sciences and phenomena-based domain disciplines.

Supporting this perspective is the System Phenomenon, wellspring of engineering opportunities and challenges. Governed by Hamilton's Principle, it is a traditional path for derivation of equations of motion or physical laws of so-called "fundamental" physical phenomena of mechanics, electromagnetics, chemistry, and thermodynamics.

We argue that laws and phenomena of traditional disciplines are less fundamental than the System Phenomenon from which they spring. This is a practical reminder of emerging higher disciplines, with phenomena, first principles, and physical laws. Contemporary examples include ground vehicles, aircraft, marine vessels, and biochemical networks; ahead are health care, distribution networks, market systems, ecologies, and the IoT.

Scientific heritage (~300 years)

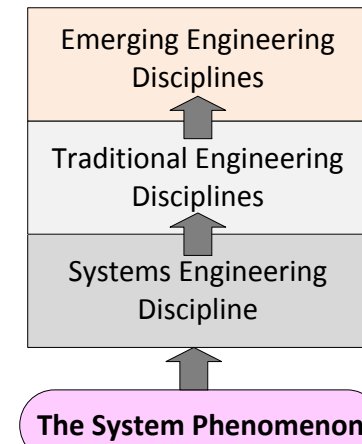

- The eventual flowering of the physical sciences depended upon the emergence of strong enough underlying model constructs (of math, physics) to better represent Nature.
- Specifically, the System Phenomenon (Newton, Lagrange, Hamilton):

A traditional view of systems engineering

Our view of systems engineering

Sufficiency for Purposes; Minimality

- Example: Fitness of model to use
 - Includes fitness of model views to intended uses, users.
- See discussions by E. Tufte, N Levinson, concerning NASA shuttle model views
- Culture plays a key part in this.
- So, measuring maturity of MBSE will take us across more subjects than technical practitioners might expect.

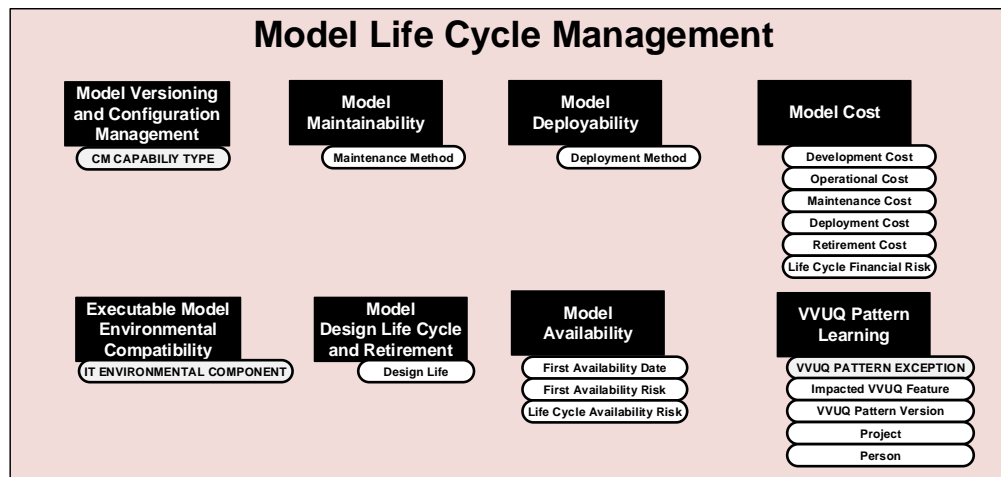

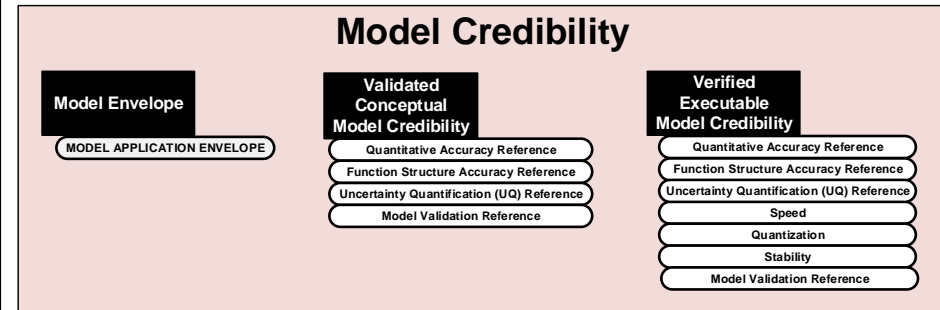

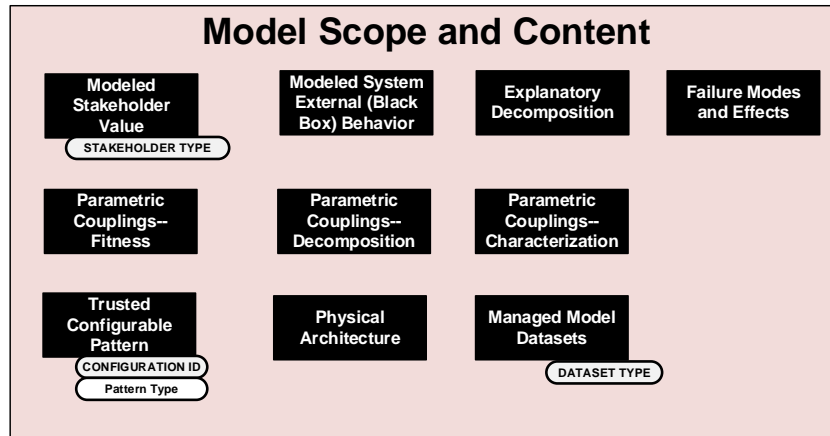

- Modeling more than just the “engineered” System 1
- Intended model uses and users, along with culture, are “System 2” issues . . .

Stakeholders for Models

| Model Stakeholder Type | Definition |
|-------------------------------|---|
| Model User | A person, group, or organization that directly uses a model for its agreed upon purpose. May include technical specialists, non-technical decision-makers, customers, supply chain members, regulatory authorities, or others. |
| Model Developer | A person who initially creates a model, from conceptualization through implementation, validation, and verification, including any related model documentation. Such a person may or may not be the same as one who subsequently maintains the model. |
| Model Maintainer | A person who maintains and updates a model after its initial development. In effect, the model maintainer is a model developer after the initial release of a model. |
| Model Deployer-Distributor | A person or organization that distributes and deploys a model into its intended usage environment, including transport and installation, through readiness for use. |
| Model Use Supporter | A person who supports or assists a Model User in applying a model for its intended use. This may include answering questions, providing advice, addressing problems, or other forms of support. |
| Regulatory Authority | An organization that is responsible for generating or enforcing regulations governing a domain. |
| Model Investor-Owner | A person or organization that invests in a model, whether through development, purchase, licenses, or otherwise, expecting a benefit from that investment. |

The ISO 15288 Processes provide the Model Stakeholder Feature Set for Planning & Assessment

(Other Features on previous slide)

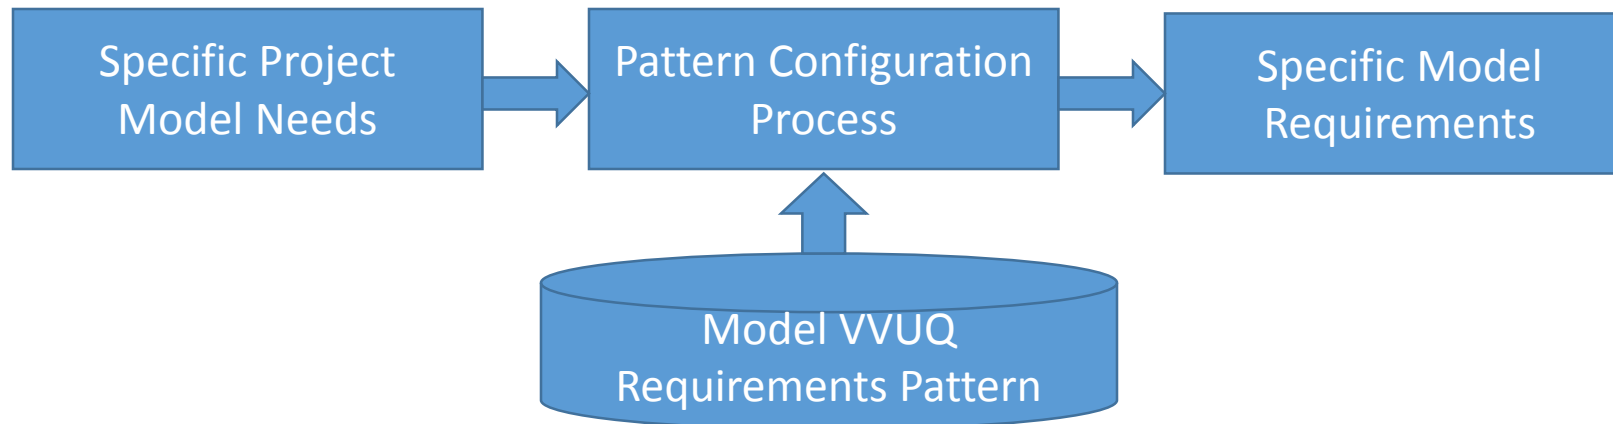

| Feature Group | Feature Name | Feature Definition | Feature Attribute | Attribute Definition | Feature Stakeholder | | | | | | | Model Type | |
|--|---|--|------------------------------|---|---------------------|-----------------|------------------|--------------------------|---------------------|----------------------|--------------------|---------------|-------------|
| | | | | | Model User | Model Developer | Model Maintainer | Mdl Deployer-Distributor | Model Use Supporter | Regulatory Authority | Mdl Investor-Owner | Physics Based | Data Driven |
| Describes the intended use, utility, and value of the model | | | | | | | | | | | | | |
| Model Utility | Model Intended Use | The intended purpose(s) or use(s) of the model. | Life Cycle Process Supported | The intended life cycle management process to be supported by the model, from the ISO15288 process list. More than one value may be listed. | X | | | | | X | X | X | X |
| | Perceived Model Value and Use | The relative level of value ascribed to the model, by those who use it for its stated purpose. | User Group Segment | The identify of using group segment (multiple) | X | | | | | X | X | X | X |
| | | | Level of Annual Use | The relative level of annual use by the segment | X | | | | | X | X | X | X |
| | | | Value Level | The value class associated with the model by that segment | X | | | | | X | X | X | X |
| | Third Party Acceptance | The degree to which the model is accepted as authoritative, by third party regulators, customers, supply chains, and other entities, for its stated purpose. | Accepting Authority | The identity (may be multiple) of regulators, agencies, customers, supply chains, accepting the model | X | | | | | X | X | X | X |
| Model Ease of Use | The perceived ease with which the model can be used, as experienced by its intended users | Perceived Model Complexity | High, Medium Low | X | | | | | X | | X | X | |

Vision for a Practical Aid to Model Community

- In establishing model credibility, a computational model is verified and validated (VV), including quantification of related uncertainties (UQ):
 - With respect to not just the system it represents, but also the Model Requirements, specifying the intended use(s), user(s), and characteristics of that model.
- This vision is to make the generation of those Model Requirements easier, more complete, and more successful than would otherwise be the case—using the Model VVUQ Pattern.

Vision for a Practical Aid to Model Community

- Vision of a guideline that includes a practical pattern for the efficient and effective planning and generation of computational models that have a higher likelihood of VVUQ and successful service.
- The smallest set of ideas necessary to achieve that goal.
- Makes use of ideas used in Pattern-Based Systems Engineering, a form of MBSE, for configurable models:

Vision for a Practical Aid to Model Community

- The foundation of this capability are the computational model's Stakeholder Features and the computational model's Requirements . . .

Stakeholders for Models

| Model Stakeholder Type | Definition |
|----------------------------|---|
| Model User | A person, group, or organization that directly uses a model for its agreed upon purpose. May include technical specialists, non-technical decision-makers, customers, supply chain members, regulatory authorities, or others. |
| Model Developer | A person who initially creates a model, from conceptualization through implementation, validation, and verification, including any related model documentation. Such a person may or may not be the same as one who subsequently maintains the model. |
| Model Maintainer | A person who maintains and updates a model after its initial development. In effect, the model maintainer is a model developer after the initial release of a model. |
| Model Deployer-Distributor | A person or organization that distributes and deploys a model into its intended usage environment, including transport and installation, through readiness for use. |
| Model Use Supporter | A person who supports or assists a Model User in applying a model for its intended use. This may include answering questions, providing advice, addressing problems, or other forms of support. |
| Regulatory Authority | An organization that is responsible for generating or enforcing regulations governing a domain. |
| Model Investor-Owner | A person or organization that invests in a model, whether through development, purchase, licenses, or otherwise, expecting a benefit from that investment. |
| IT Environment Maintainer | A person or organization that maintains the IT environment utilized by a computational model. |

Computational Model Feature Groups: Configurable for Specific Models

Model Identity and Focus

Identifies the main subject or focus of the model.

Model Utility

Describes the intended use, user, utility, and value of the model.

Model Scope and Content

Describes the scope of content of the model.

Model Credibility

Describes the credibility of the model.

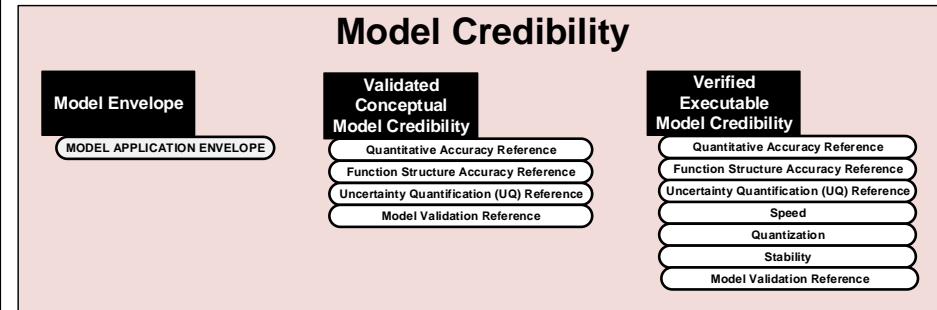

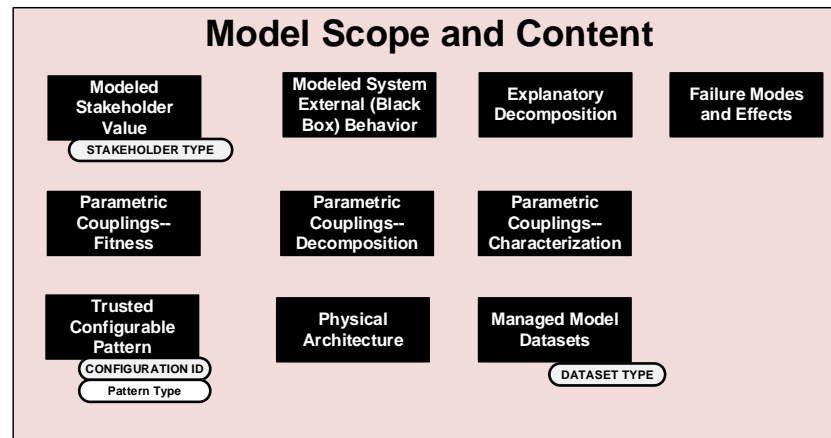

Model Life Cycle Management

Describes the related model life cycle management capabilities.

Model Representation

Describes the representation used by the model.

Computational Model Feature Groups: 27 Features, in 6 Feature Groups, Configurable for Specific Models

Legend:

| Stakeholder Feature Model for Computational Models | | |
|--|-------------------|----------------------|
| Version: 1.5.4 | Date: 31 Aug 2017 | Drawn By: B Schindel |

Computational Model Feature Groups: Configurable for Specific Models

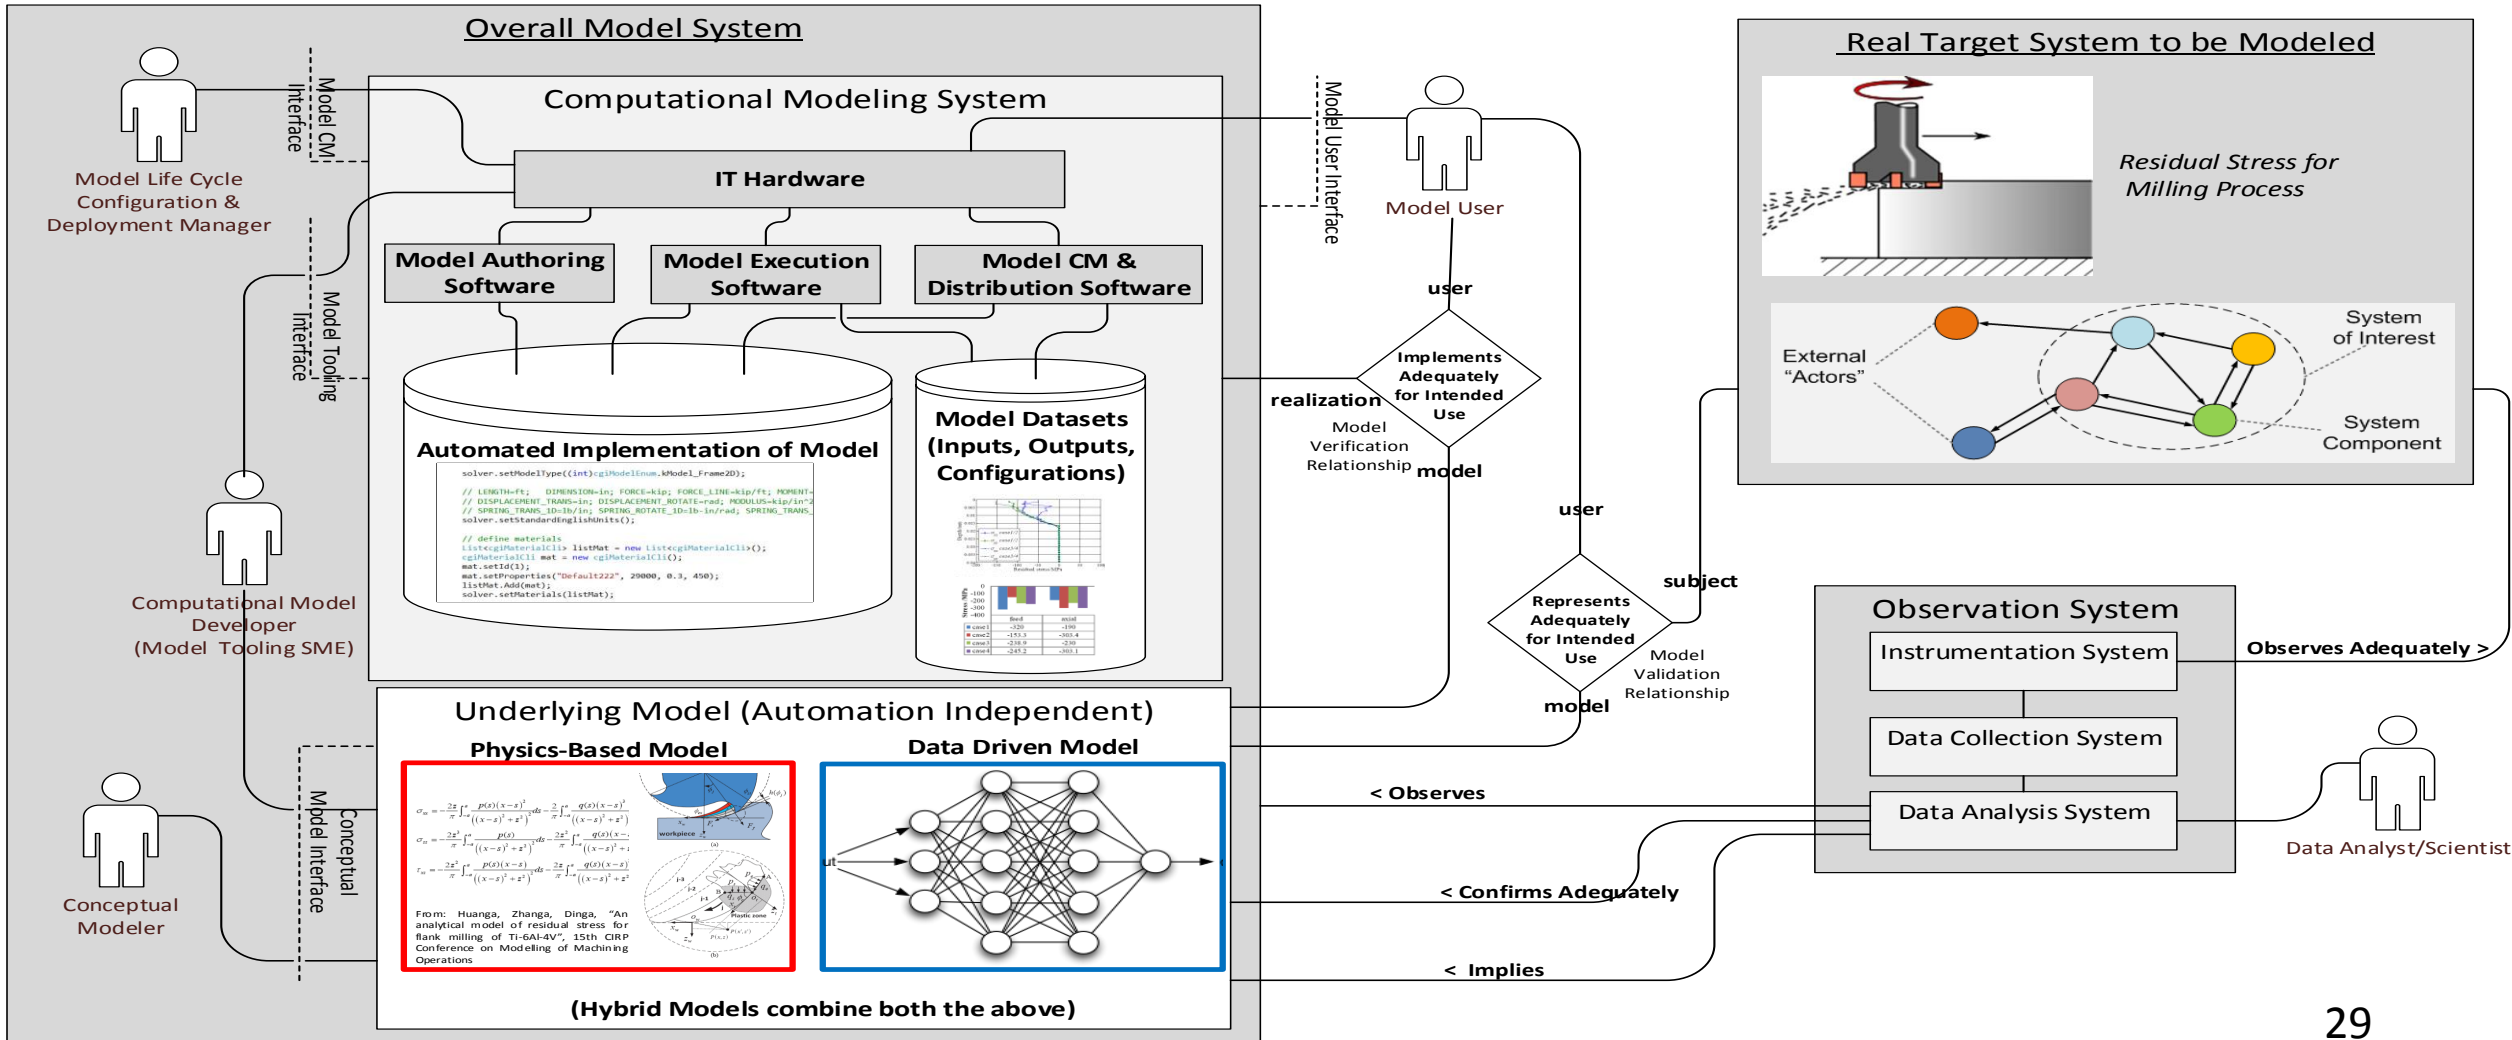

- The Stakeholder Features are configurable Stakeholder expectations, intentions, and valued aspects for a computational model:
 - These can be “configured” like Lego® blocks, as a form of checklist to rapidly create the stakeholder-level expectations for a computational model.
 - And from them, the more technical Requirements for the model follow.

Generation of Model Stakeholder Features

- The Model Stakeholder Feature Pattern is configured for a specific project by populating or depopulating the pattern's generic Features, and setting the values of its Feature Attributes:

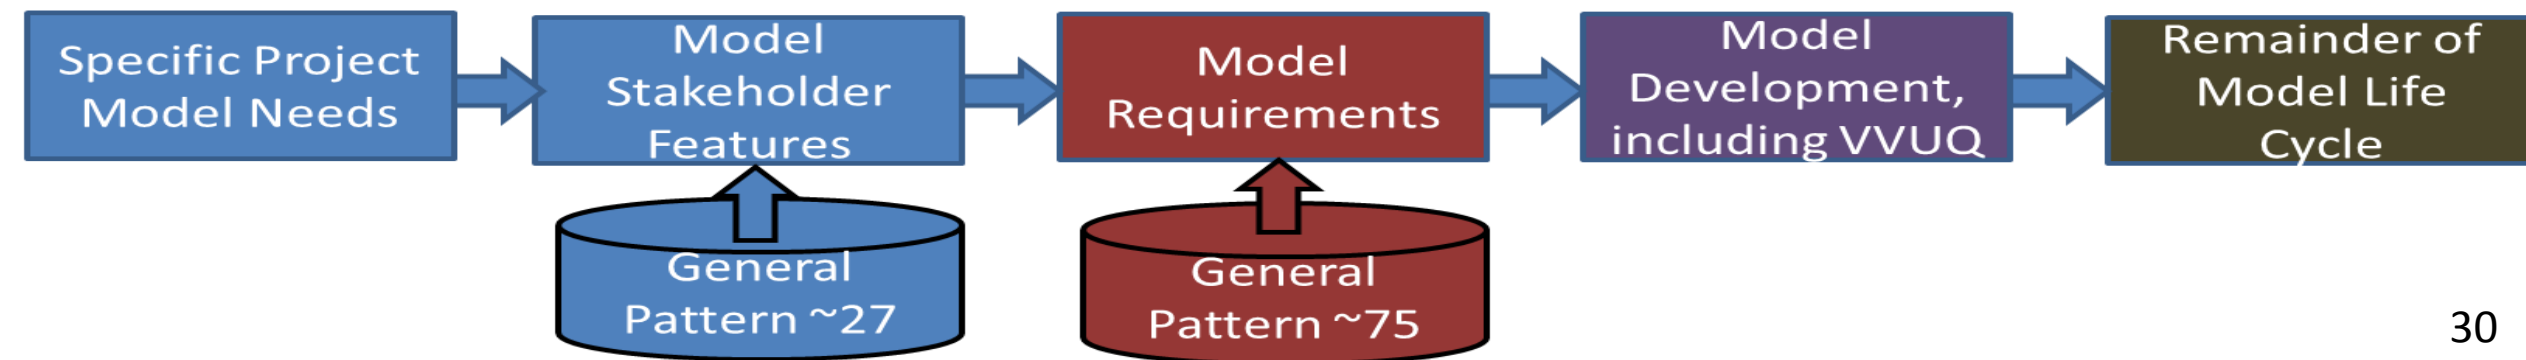

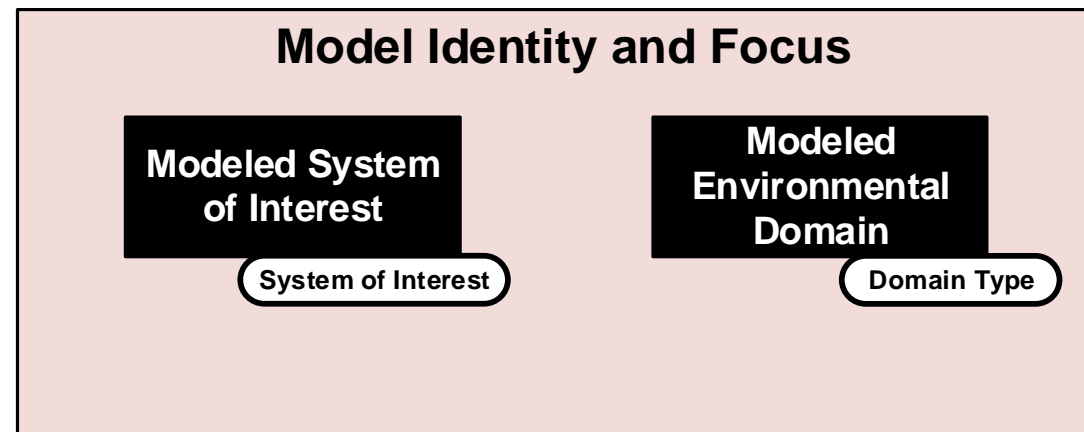

System Reference Boundaries: Computational Modeling Domain

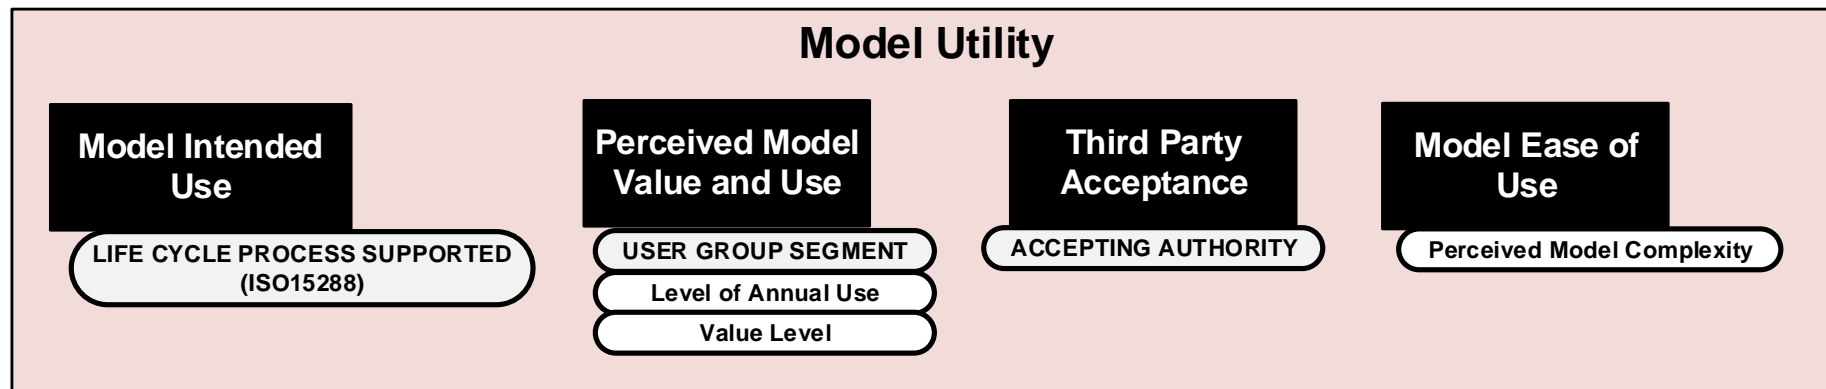

Requirements for Models

- Requirements for a specific computational model are the basis of subsequent validation and verification of the model.
- The Requirements for a computational model are implied by the Stakeholder Features (see above), but with more details configured into them.
- Approximately 75 configurable general Requirements for Models have been identified and traced to the Stakeholder Features, in the current draft of the Model VVUQ Pattern.
- After these have been further vetted and polished in this project, they provide a rapid start way to generate a high quality set of Model Requirements in a production project.

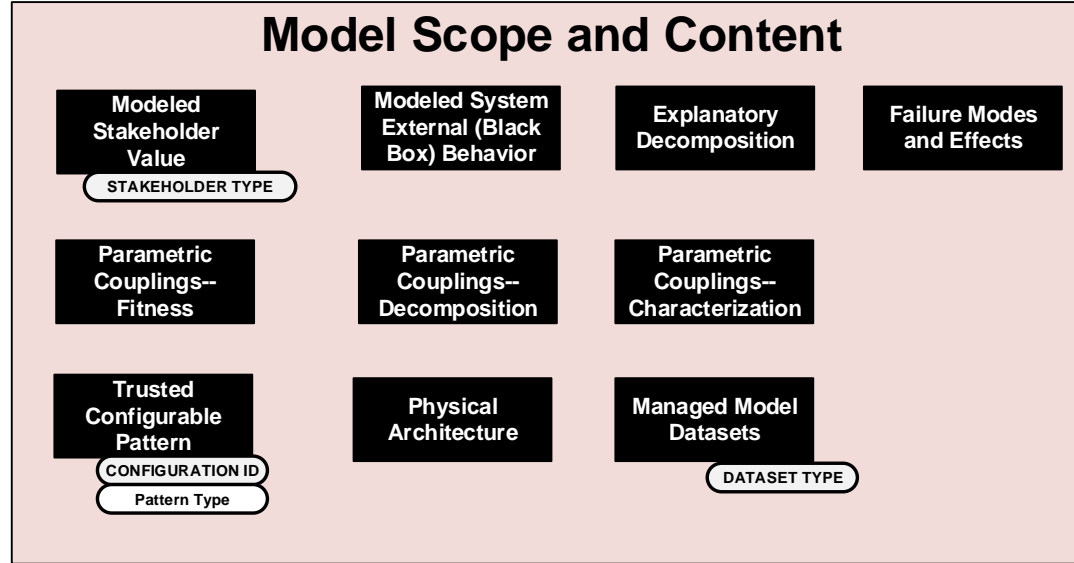

| Feature Group | Feature Name | Feature Definition | Feature Attribute | Attribute Definition | Feature Stakeholder | | | | | | | Model Type | |
|--|------------------------------|---|--------------------|---|---------------------|-----------------|------------------|--------------------------|---------------------|----------------------|--------------------|---------------|-------------|
| | | | | | Model User | Model Developer | Model Maintainer | Mdl Deployer-Distributor | Model Use Supporter | Regulatory Authority | Mdl Investor-Owner | Physics Based | Data Driven |
| Identifies the main subject or focus of the model | | | | | | | | | | | | | |
| Model Identity and Focus | Modeled System of Interest | Identifies the type of system this model describes. | System of Interest | Name of system of interest, or class of systems of interest | X | | | | | X | X | X | X |
| | Modeled Environmental Domain | Identifies the type of external environmental domain(s) that this model includes. | Domain Type(s) | Name(s) of modeled domains (manufacturing, distribution, use, etc.) | X | | | | | X | X | X | X |

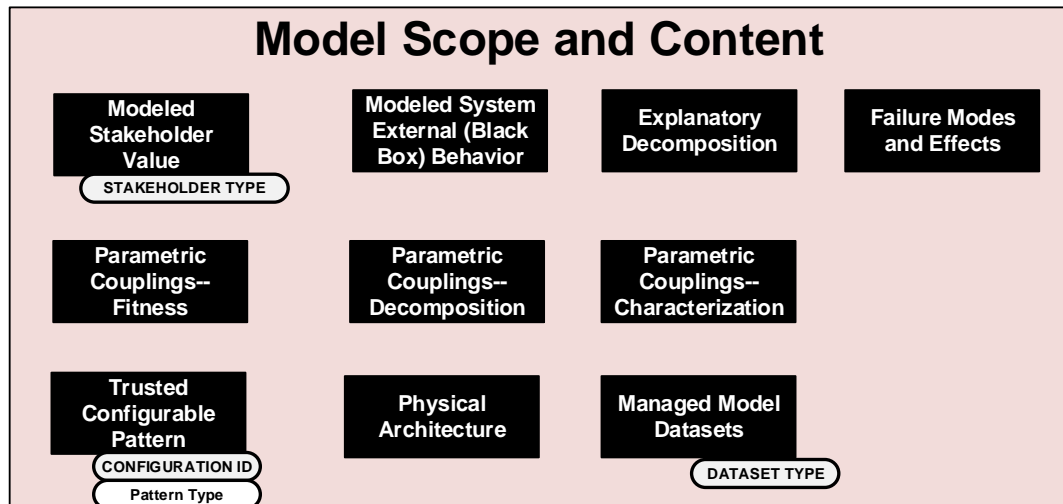

| Feature Group | Feature Name | Feature Definition | Feature Attribute | Attribute Definition | Feature Stakeholder | | | | | | | Model Type | |
|--|---|--|------------------------------|---|---------------------|-----------------|------------------|--------------------------|---------------------|----------------------|--------------------|---------------|-------------|
| | | | | | Model User | Model Developer | Model Maintainer | Mdl Deployer-Distributor | Model Use Supporter | Regulatory Authority | Mdl Investor-Owner | Physics Based | Data Driven |
| Describes the intended use, utility, and value of the model | | | | | | | | | | | | | |
| Model Utility | Model Intended Use | The intended purpose(s) or use(s) of the model. | Life Cycle Process Supported | The intended life cycle management process to be supported by the model, from the ISO15288 process list. More than one value may be listed. | X | | | | | X | X | X | X |
| | Perceived Model Value and Use | The relative level of value ascribed to the model, by those who use it for its stated purpose. | User Group Segment | The identify of using group segment (multiple) | X | | | | | X | X | X | X |
| | | | Level of Annual Use | The relative level of annual use by the segment | X | | | | | X | X | X | X |
| | | | Value Level | The value class associated with the model by that segment | X | | | | | X | X | X | X |
| | Third Party Acceptance | The degree to which the model is accepted as authoritative, by third party regulators, customers, supply chains, and other entities, for its stated purpose. | Accepting Authority | The identity (may be multiple) of regulators, agencies, customers, supply chains, accepting the model | X | | | | | X | X | X | X |
| Model Ease of Use | The perceived ease with which the model can be used, as experienced by its intended users | Perceived Model Complexity | High, Medium Low | X | | | | | X | | X | X | |

Model Scope and Content

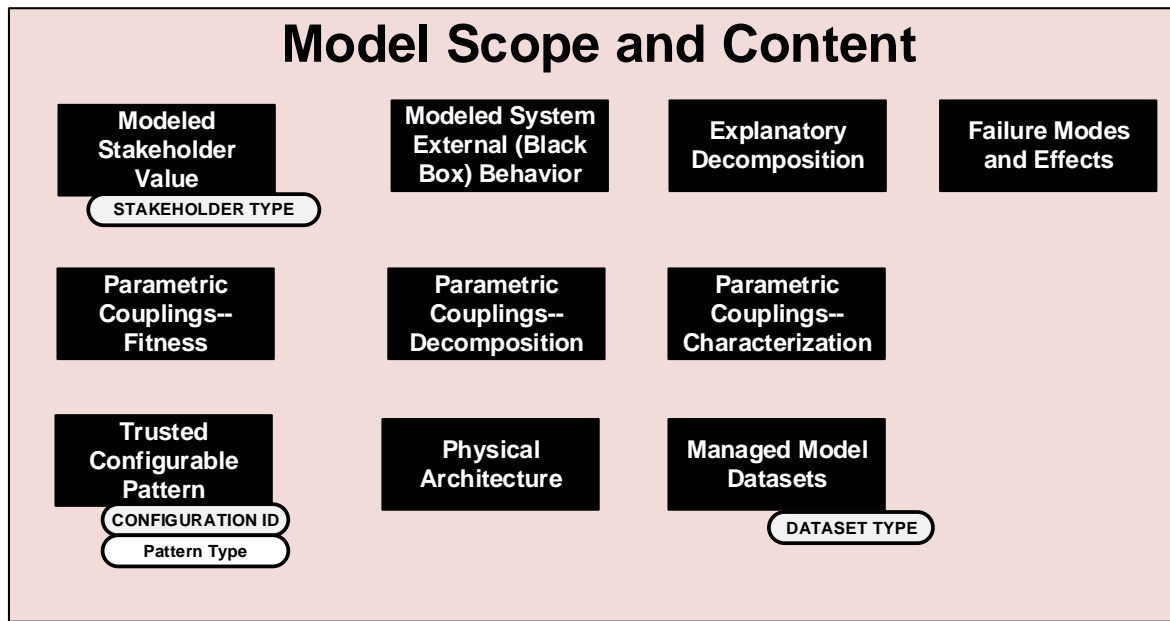

| Feature Group | Feature Name | Feature Definition | Feature Attribute | Attribute Definition | Feature Stakeholder | | | | | | | Model Type | | |
|--|--|---|-------------------|---|---------------------|-----------------|------------------|--------------------------|---------------------|----------------------|--------------------|---------------|-------------|---|
| | | | | | Model User | Model Developer | Model Maintainer | Mdl Deployer-Distributor | Model Use Supporter | Regulatory Authority | Mdl Investor-Owner | Physics Based | Data Driven | |
| Describes the scope of content of the model | | | | | | | | | | | | | | |
| Model Scope of Content | Modeled Stakeholder Value | The capability of the model to describe fitness or value of the System of Interest, by identifying its stakeholders and modeling the related Stakeholder Features. | Stakeholder Type | Classes of covered stakeholders (may be multiple) | X | | | | | | X | X | X | X |
| | Modeled System External (Black Box) Behavior | The capability of the model to represent the objective external ("black box") technical behavior of the system, through significant interactions with its environment, based on modeled input-output exchanges through external interfaces, quantified by technical performance measures, and varying behavioral modes. | | | X | | | | | X | | | X | X |
| | Explanatory Decomposition | The capability of the model to represent the decomposition of its external technical behavior, as explanatory internal ("white box") internal interactions of decomposed roles, further quantified by internal technical performance measures, and varying internal behavioral modes. | | | X | | | | | X | | | X | |
| | Physical Architecture | The capability of the model to represent the physical architecture of the system of interest. This includes identification of its major physical components and their architectural relationships. | | | X | | | | | X | | | X | |

Model Scope and Content

| Feature Group | Feature Name | Feature Definition | Feature Attribute | Attribute Definition | Feature Stakeholder | | | | | | | Model Type | |
|--|--|---|-------------------|---|---------------------|-----------------|------------------|--------------------------|---------------------|----------------------|--------------------|---------------|-------------|
| | | | | | Model User | Model Developer | Model Maintainer | Mdl Deployer-Distributor | Model Use Supporter | Regulatory Authority | Mdl Investor-Owner | Physics Based | Data Driven |
| Describes the scope of content of the model | | | | | | | | | | | | | |
| | Parametric Couplings--Fitness | The capability of the model to represent quantitative (parametric) couplings between stakeholder-valued measures of effectiveness and objective external black box behavior performance measures. | | | X | | | | | X | | X | X |
| | Parametric Couplings--Decomposition | The capability of the model to represent quantitative (parametric) couplings between objective external black box behavior variables and objective internal white box behavior variables. | | | X | | | | | X | | X | X |

- A System is a set of interacting components:

- By “interact”, we mean exchanging energy, forces, mass flows, or information, resulting in changes of state:

- So, a (Manufacturing or other) Process is a type of System (but not all Systems are such Processes):

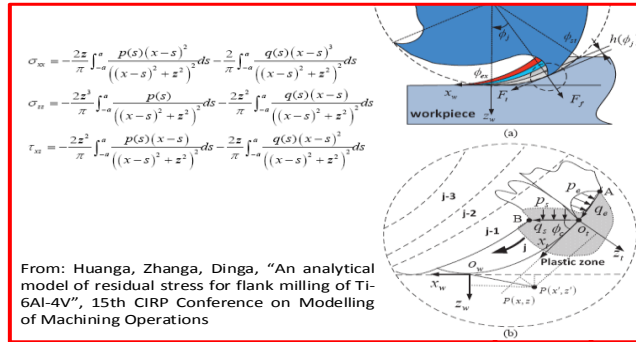

- The “Black Box” view of a system sees only its external behavior
- The “White Box” view of a system sees its internal interactions

Physics-Based Model

- Predicts the external behavior of the System of Interest, visible externally to the external actors with which it interacts.
- Models internal physical interactions of the System of Interest, and how they combine to cause/explain externally visible behavior.
- Model has both external predictive value and phenomena-based internal-to-external explanatory value.
- Overall model may have high dimensionality.

Data Driven Model

- Predicts the external behavior of the System of Interest, visible to the external actors with which it interacts.
- Model intermediate quantities may not correspond to internal or external physical parameters, but combine to adequately predict external behavior, fitting it to compressed relationships.
- Model has external predictive value, but not internal explanatory value.
- Overall model may have reduced dimensionality.

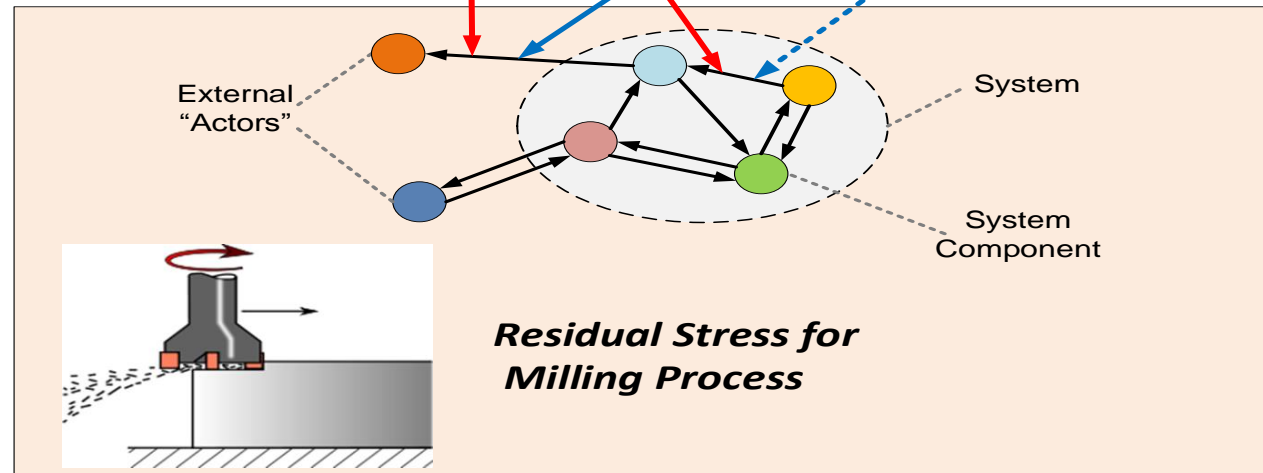

- Physical scientists and phenomena models from their disciplines can apply here.
- The hard sciences physical laws, and how they can be used to explain the externally visible behavior of the system of interest.

predicts, explains

predicts

optional

- Data scientists and their math/IT tools can apply here (data mining, pattern extraction, cognitive AI tooling).
- Tools and methods for discovery / extraction of recurring patterns of external behavior.

Real System Being Modeled

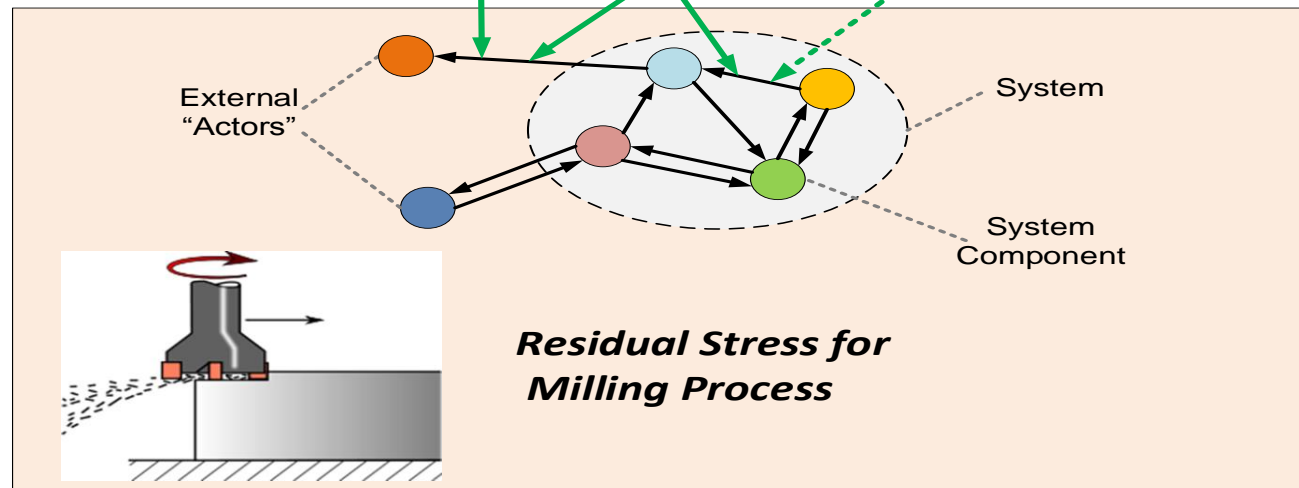

Hybrid Model: Both Data Driven and Physics-Based

- Predicts the external behavior of the System of Interest, visible externally to the external actors with which it interacts.
- Models (some aspects of) internal physical interactions of the System of Interest, and how they combine to cause/explain (some aspects of) externally visible behavior.
- Model has both external predictive value and (some) phenomena-based internal-to-external explanatory value.
- (Some) model intermediate quantities may not correspond to internal or external physical parameters, but combine to adequately predict external behavior, fitting it to compressed relationships.
- Model has external predictive value, but (for some aspects) not internal explanatory value.

- Physical scientists and phenomena models from their disciplines can apply here.
- The hard sciences physical laws, and how they can be used to explain the externally visible behavior of the system of interest.

- Data scientists and their math/IT tools can apply here (data mining, pattern extraction, cognitive AI tooling).
- Tools and methods for discovery / extraction of recurring patterns of external behavior.

Real System Being Modeled

Samples from a simple illustrative example

- Product: Oil Filter
- Manufacturing System: Oil Filter Mfg System

Physical Architecture Models describes the physical portion of the technology, to which Functional Roles will later be allocated and optimized . . .

Product Physical Architecture

Architecture 1: Laminated and Accordion Pleated Filtration Media, Flow Orthogonal to Plane of Media, Additive Impregnated

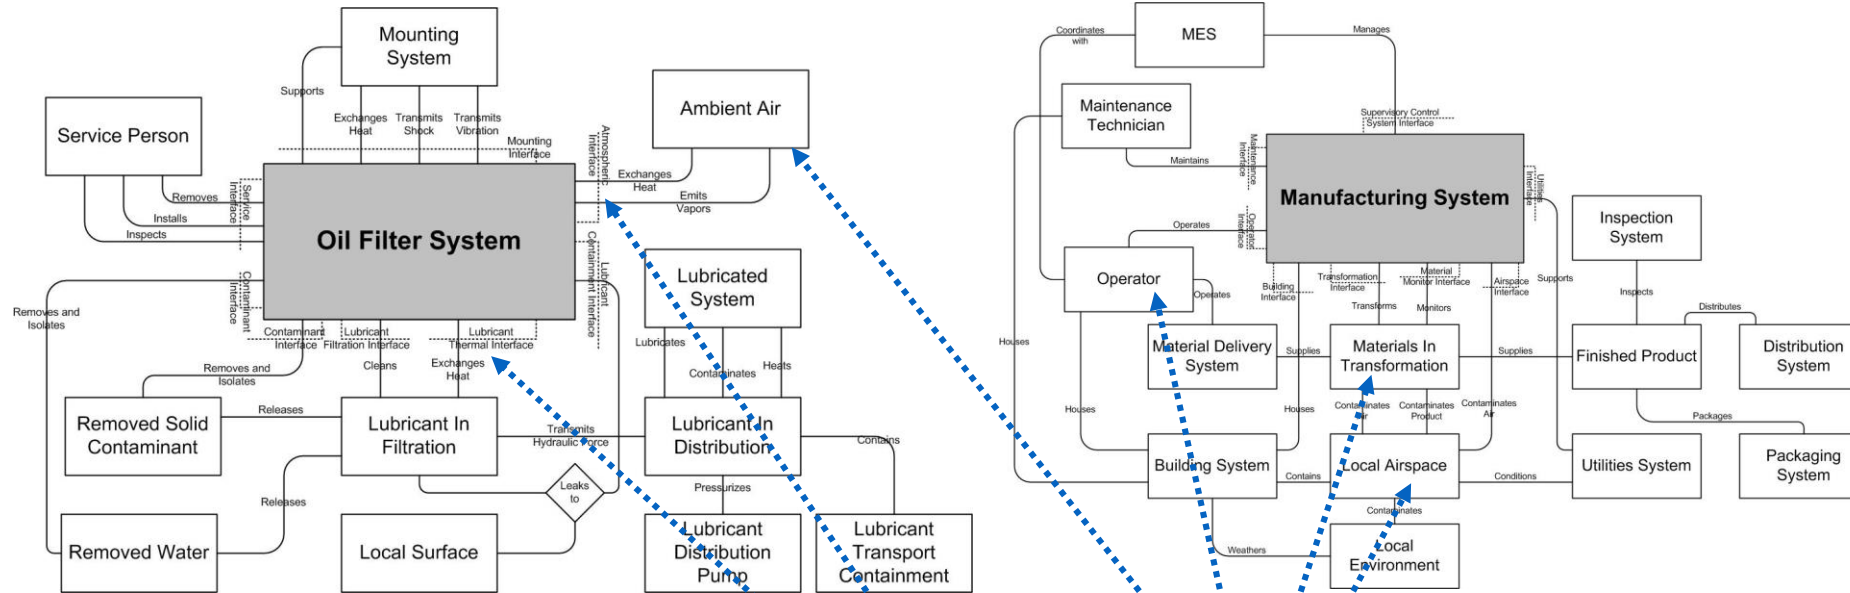

Architecture 2: Wound Filtration Fiber, Flow Orthogonal to Plane of Windings, Additive Impregnated

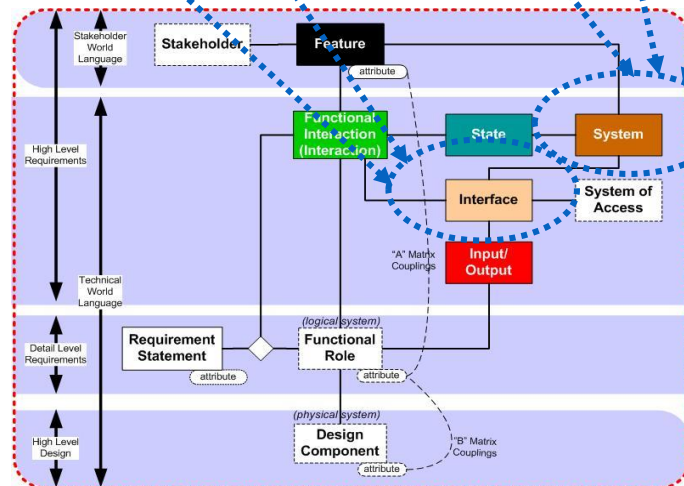

Domain Models directly help by discovering and capturing all the external systems physically interacting with the Subject System—these are the source of all Functional Requirements.

Domain Models

Product Application Domain Model

Manufacturing Domain Model

Stakeholder Feature Models address a key SE challenge by making explicit the ultimate stakeholder outcomes against which all decisions, trade-offs, optimizations, and outcomes will be scored and selected. This covers all Stakeholders, not just Customers (e.g., Shareholders, Community, etc.)

Product Stakeholder Features, Feature Attributes

Microsoft Excel - Oil Filter Pattern V1.1.1.xls

The feature of providing services with a specified level of reliability over the normal operating life of a system.

| | G | H | I | K | L | M | N | O | P |
|----|--|--------------------------------|---|---------------------------|----|--|-----------------|---|-------------|
| | Feature Name | Config Rule Ref for Population | Feature Definition | Feature Attribute | PK | Attribute Definition | Attribute Units | Attribute Values | Featu Statu |
| 1 | Engine Lubricant Filtration Feature | Mandatory | The feature of maintaining a lubricating fluid at a required level of cleanliness while it is in service in a specified application, including the removal of contaminants associated with the application. | Service Application | X | The type of lubricated system application supported by a lubricant filtration system. More than one type may be instantiated for a single product configuration. | N/A | Consumer Automotive, Commercial Automotive, Fixed Base Engine System, Harsh Environment, High Thermal Environment, Cold Environment | Namec |
| 2 | Engine Lubricant Filtration Feature | | | Lubricant Type | | The type of lubricating fluid to be used. | N/A | 0 | Namec |
| 3 | Engine Lubricant Filtration Feature | | | Lubricant Flow Rate | | The rate at which the lubricating fluid must be circulated in order to meet equipment lubrication objectives. | N/A | High, Medium, Low | Namec |
| 4 | Engine Lubricant Filtration Feature | | | Lubricant Pressure Range | | The amount of hydraulic pressure under which the lubricant will circulate. | N/A | High, Medium, Low | Namec |
| 5 | Engine Lubricant Filtration Feature | | | Filter Efficiency Class | | The range of filtration efficiency provided by the filter | N/A | 0 | Namec |
| 6 | Mechanical Compatibility Feature | Mandatory | The feature of being compatible in form factor and mechanical interface with the system in which the system will be installed. | Mechanical Interface Type | | The mechanical form of an interface. | N/A | 0 | Namec |
| 7 | Mechanical Compatibility Feature | | | Spatial Form Factor | | The three dimensional structure of a component, subsystem, or space within a system reserved for a component or subsystem. | N/A | 0 | Namec |
| 8 | Cost of Operation Feature | Mandatory | The feature of supporting cost-effective lubrication of an application, by minimizing the cost of lubrication consumables per operating hour. | Lubricant Life | | The amount of time, in operating hours, that a lubricant is intended to operate, meeting requirements within the specified environment, before it is replaced. | N/A | Standard, Long Life | |
| 9 | Cost of Operation Feature | | | Service Life | | The amount of time, in operating hours, that a lubricant filter is intended | N/A | Standard, Long Life | |
| 10 | Cost of Operation Feature | | | | | | | | |

Ready

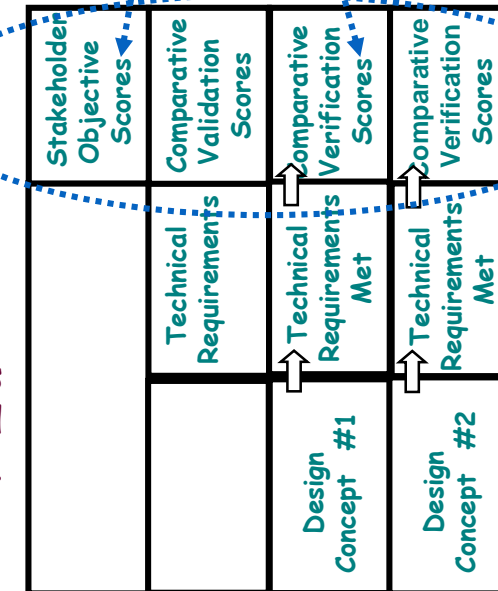

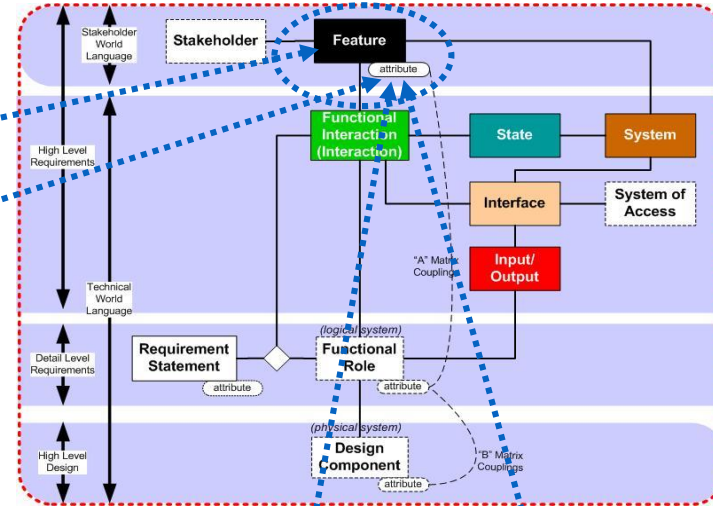

Features are collections of Functional Interactions (behaviors) having value to Stakeholders; their Attributes quantify that value impact. Features are in language of Stakeholders.

Product Stakeholder Features, Feature Attributes

Microsoft Excel - Oil Filter Pattern V1.1.1.xls

The feature of providing services with a specified level of reliability over the normal operating life of a system.

| Feature Name | Config Rule Ref for Population | Feature Definition | Feature Attribute | PK | Attribute Definition | Attribute Units | Attribute Values | Feature Status |
|-------------------------------------|--------------------------------|---|---------------------------|----|---|-----------------|---|----------------|
| Engine Lubricant Filtration Feature | Mandatory | The feature of maintaining a lubricating fluid at a required level of cleanliness while it is in service in a specified application, including the removal of contaminants associated with the application. | Service Application | X | The type of lubricated system application supported by a lubricant filtration system. More than one type may be instantiated for a single product configuration. | N/A | Consumer Automotive, Commercial Automotive, Fixed Base Engine System, Harsh Environment, High Thermal Environment, Cold Environment | Named |
| Engine Lubricant Filtration Feature | | | Lubricant Type | | The type of lubricating fluid to be used. | N/A | 0 | Named |
| Engine Lubricant Filtration Feature | | | Lubricant Flow Rate | | The rate at which the lubricating fluid must be circulated in order to meet equipment lubrication objectives. | N/A | High, Medium, Low | Named |

| Engine Lubricant Filtration Feature | | | Filter Efficiency Class | | The range of filtration efficiency provided by the filter. | N/A | 0 | Named |
| Mechanical Compatibility Feature | Mandatory | The feature of being compatible in form factor and mechanical interface with the system in which the system will be installed. | Mechanical Interface Type | | The mechanical form of an interface. | N/A | 0 | Named |
| Mechanical Compatibility Feature | | | Spatial Form Factor | | The three dimensional structure of a component, subsystem, or space within a system reserved for a component or subsystem. | N/A | 0 | Named |
| Cost of Operation Feature | Mandatory | The feature of supporting cost-effective lubrication of an application by minimizing the cost of lubrication consumables per operating hour. | Lubricant Life | | The amount of time, in operating hours, that a lubricant is intended to operate, meeting requirements within the specified environment, before it is replaced. | N/A | Standard, Long Life | |
| Cost of Operation Feature | | | Service Life | | The amount of time, in operating hours, that a lubricant filter is intended to operate, meeting requirements within the specified environment, before it is replaced. | N/A | Standard, Long Life | |

Alternate designs, different configurations, and technology generations are all ultimately "Scored" in lower-dimension trade-off space defined by the Stakeholder Feature Attributes.

For example: Every FMEA (Failure Mode Effects Analysis) failure impact can be expressed in terms of Feature Attributes.

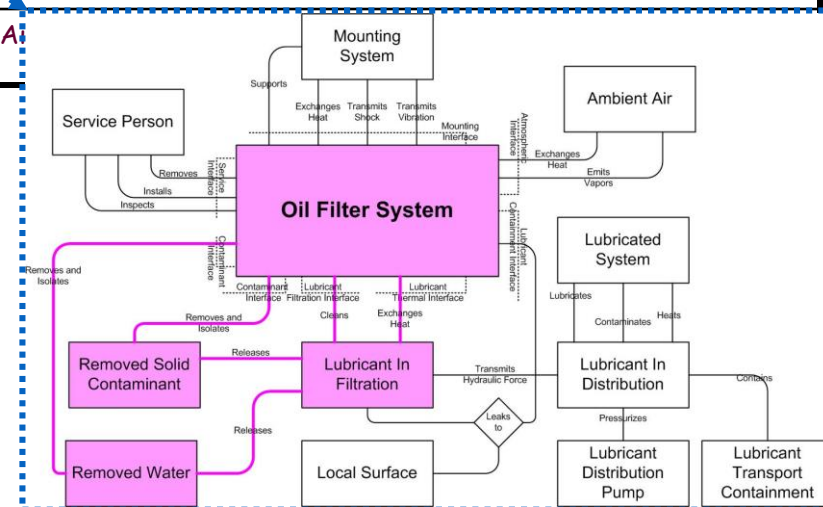

Configuration Score Sheet

Functional Interaction Models a key SE challenge by discovering and describing all external interactions of a Subject System. This leads to all functional requirements and thereafter all other requirements, in the Detail Requirements Model.

Product Functional Interactions, Roles

| Functional Interaction | Functional Roles |
|----------------------------|--|
| Filter Lubricant | Lubricant in Filtration, Oil Filter System, Removed Solid Contaminant, Removed Water |
| Install Filter | Service Person, Filter |
| Monitor Filter | Filter, Monitor & Control System |
| Prevent Vapor Leakage | Lubricant, Vapor, Filter, Atmosphere |
| Prevent Lubricant Leakage | Lubricant, Filter, Local Surface |
| Transmit Shock & Vibration | Filter, Mounting System |
| Transmit Thermal Energy | Filter, Lubricant, Mounting System, Ambient Air |

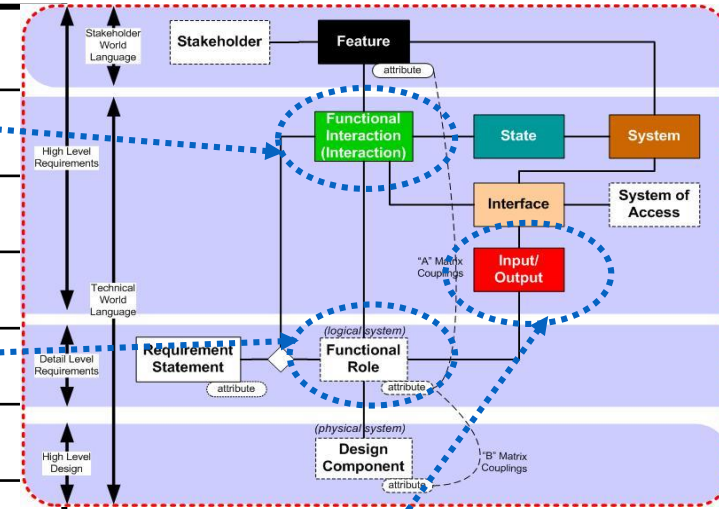

Every system directly interacting with the Subject System (Oil Filter System) contributes to its Requirements.

An Interaction of Systems, expressed as an external (outcome) relationship in which systems impact each other's states. Interacting systems fill Roles in the Interaction. Interactions technically characterize (model) the behaviors summarized by stakeholder-valued Features.

Product Functional Interactions, Roles

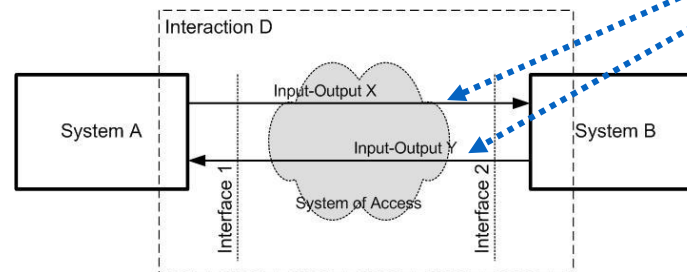

| Functional Interaction | Functional Roles |
|----------------------------|--|
| Filter Lubricant | Lubricant in Filtration, Oil Filter System, Removed Solid Contaminant, Removed Water |
| Change Filter | Service Person, Filter |
| Monitor Filter | Filter, Monitor & Control System |
| Prevent Vapor Leakage | Lubricant, Vapor, Filter, Atmosphere |
| Prevent Lubricant Leakage | Lubricant, Filter, Local Surface |
| Transmit Shock & Vibration | Filter, Mounting System |
| Transmit Thermal Energy | Filter, Lubricant, Mounting System, Ambient Air |

Input/Outputs exchanged during these interactions are:

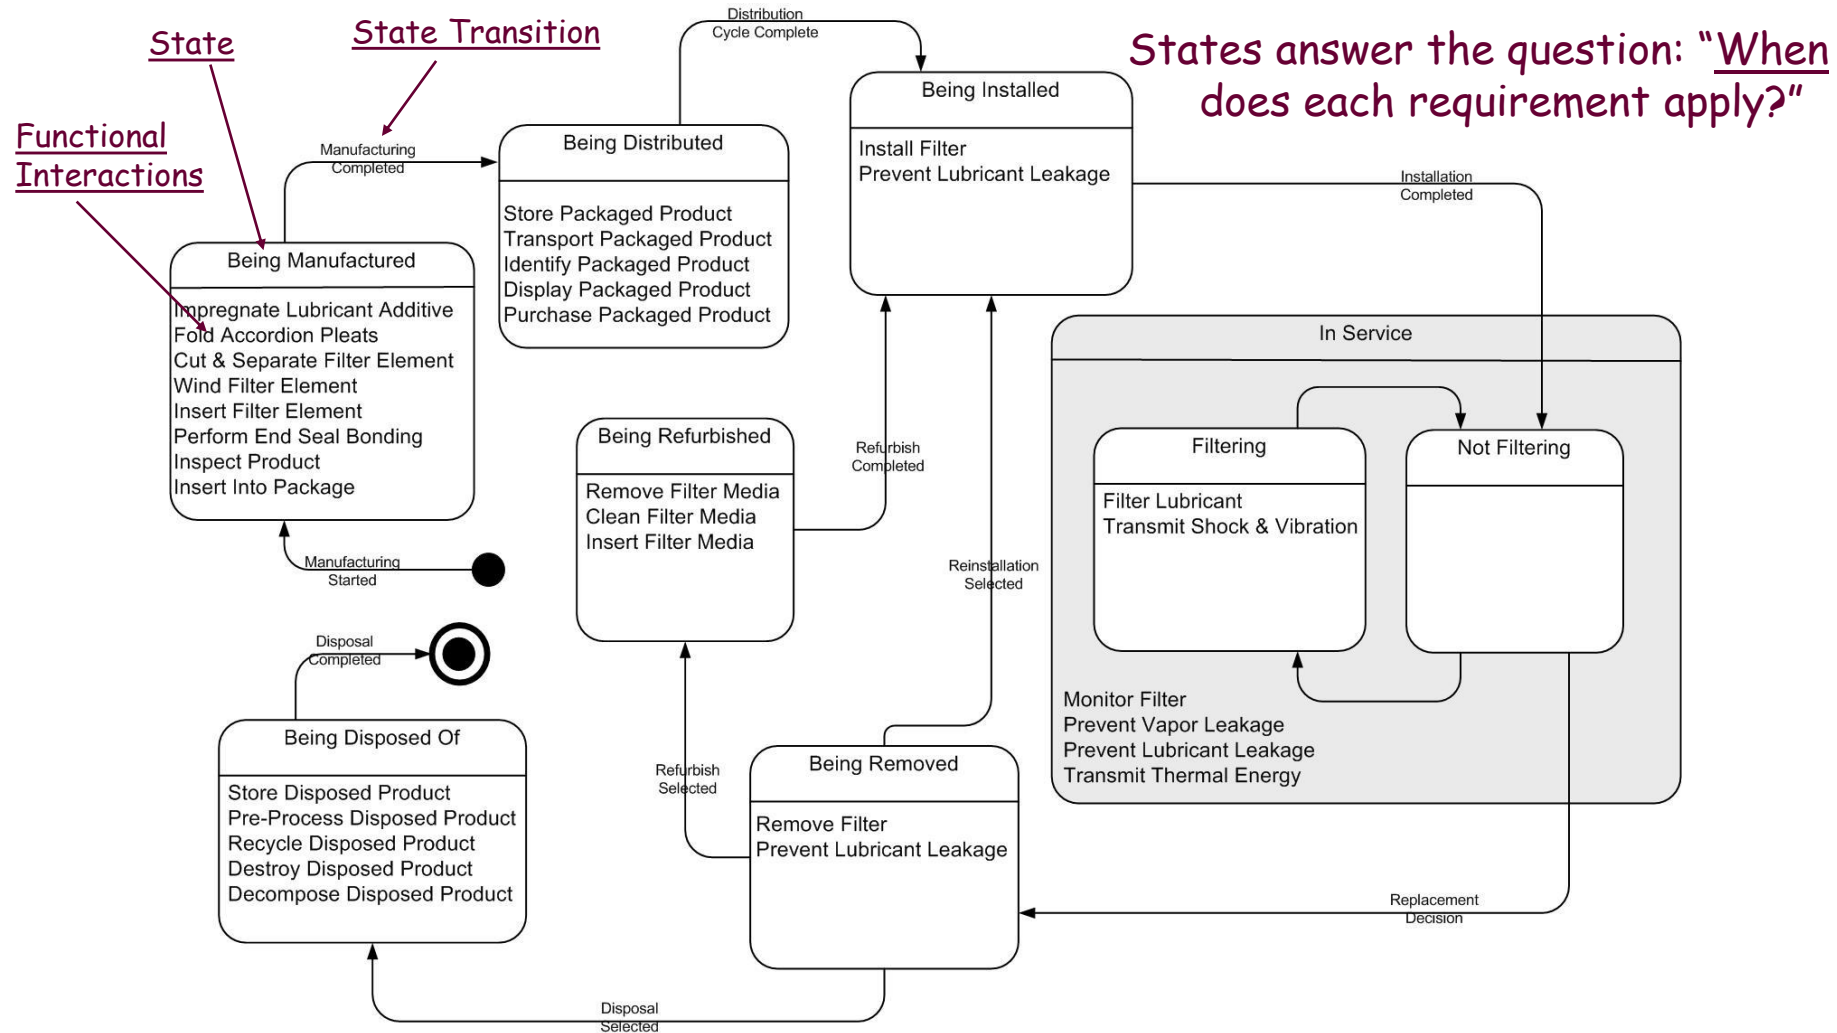

- Energy
- Force
- Mass
- Information

Interactions involve two or more systems.

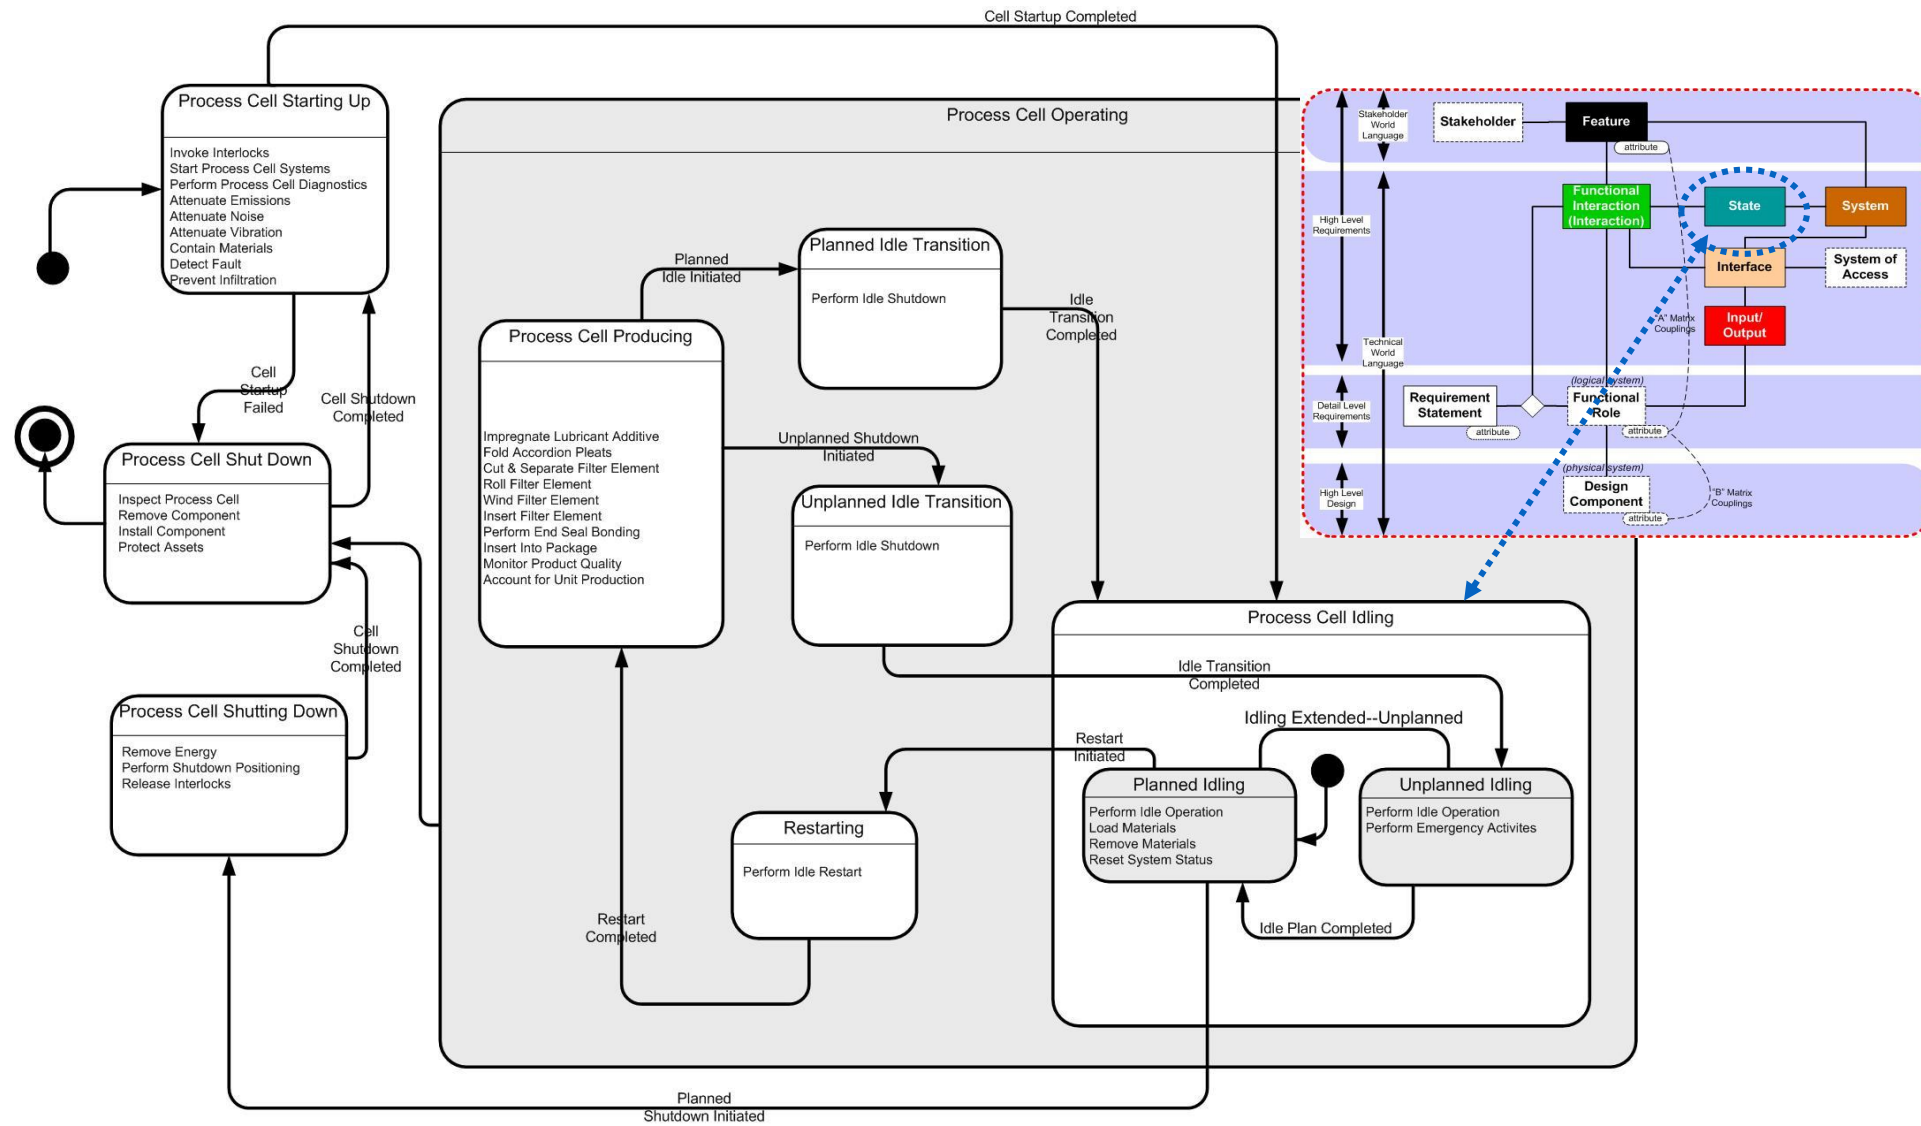

State Models directly address a key SE challenge by discovering and describing all Situations, Modes, or Use Cases (environmental states) that a Subject System will encounter. These are associated with Functional Interactions that lead directly to requirements. State Models can also describe Designs.

Product State Model

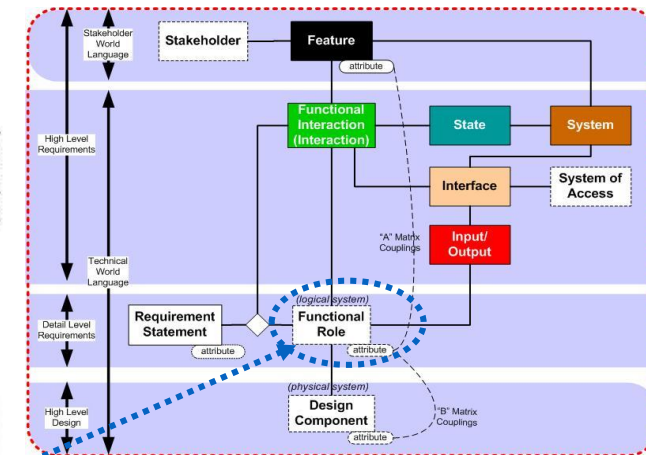

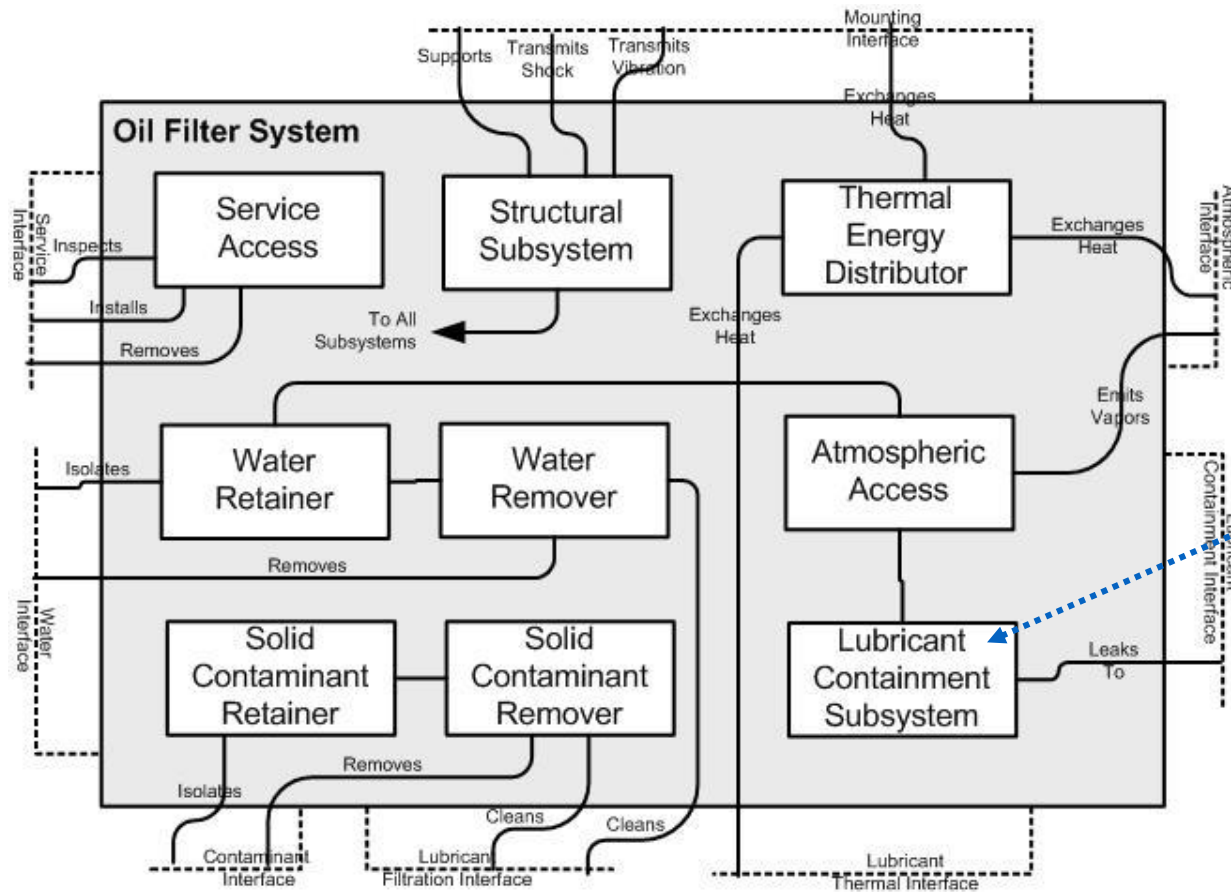

States are Situations (Modes, Use Cases, Phases) that will be encountered in the environment of a Subject System, in which it is required to meet certain requirements.

Manufacturing System State Model

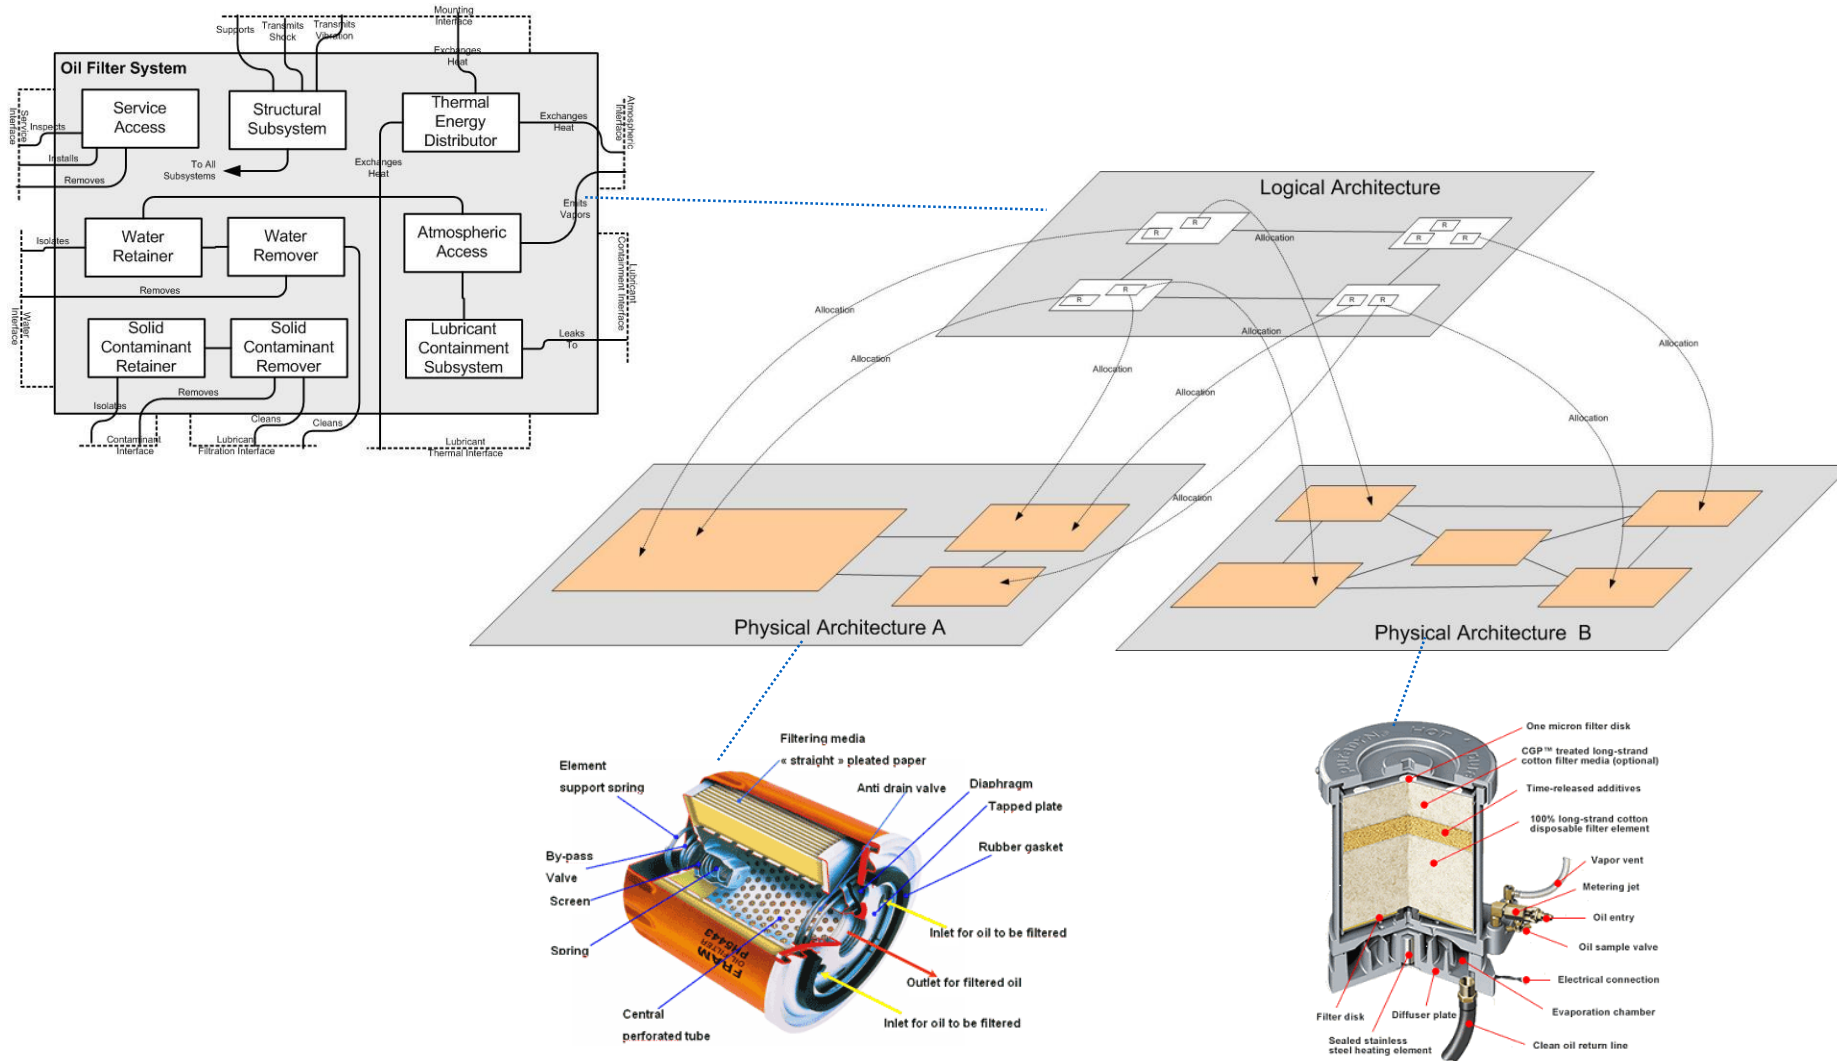

Logical Architecture Models directly address key SE challenges by partitioning the structure of requirements into Logical Roles independent of design, then address more SE challenges by stimulating design ideation and role allocation to physical designs and future technologies.

Product Logical Architecture Model

Directly addressing a key SE challenge, multiple alternate physical architectures are typically supported by a single Logical Architecture! This provides a powerful means for managing across Technologies & Configurations, and enhances Platform Management.

Alternate Technologies, Family Configurations, Roadmaps

What Is the Smallest Model of a System?

Abstract. How we represent systems is fundamental to the history of mathematics, science, and engineering. Model-based engineering methods shift the nature of representation of systems from historical prose forms to explicit data structures more directly comparable to those of science and mathematics. However, using models does not guarantee simpler representation--indeed a typical fear voiced about models is that they may be too complex.

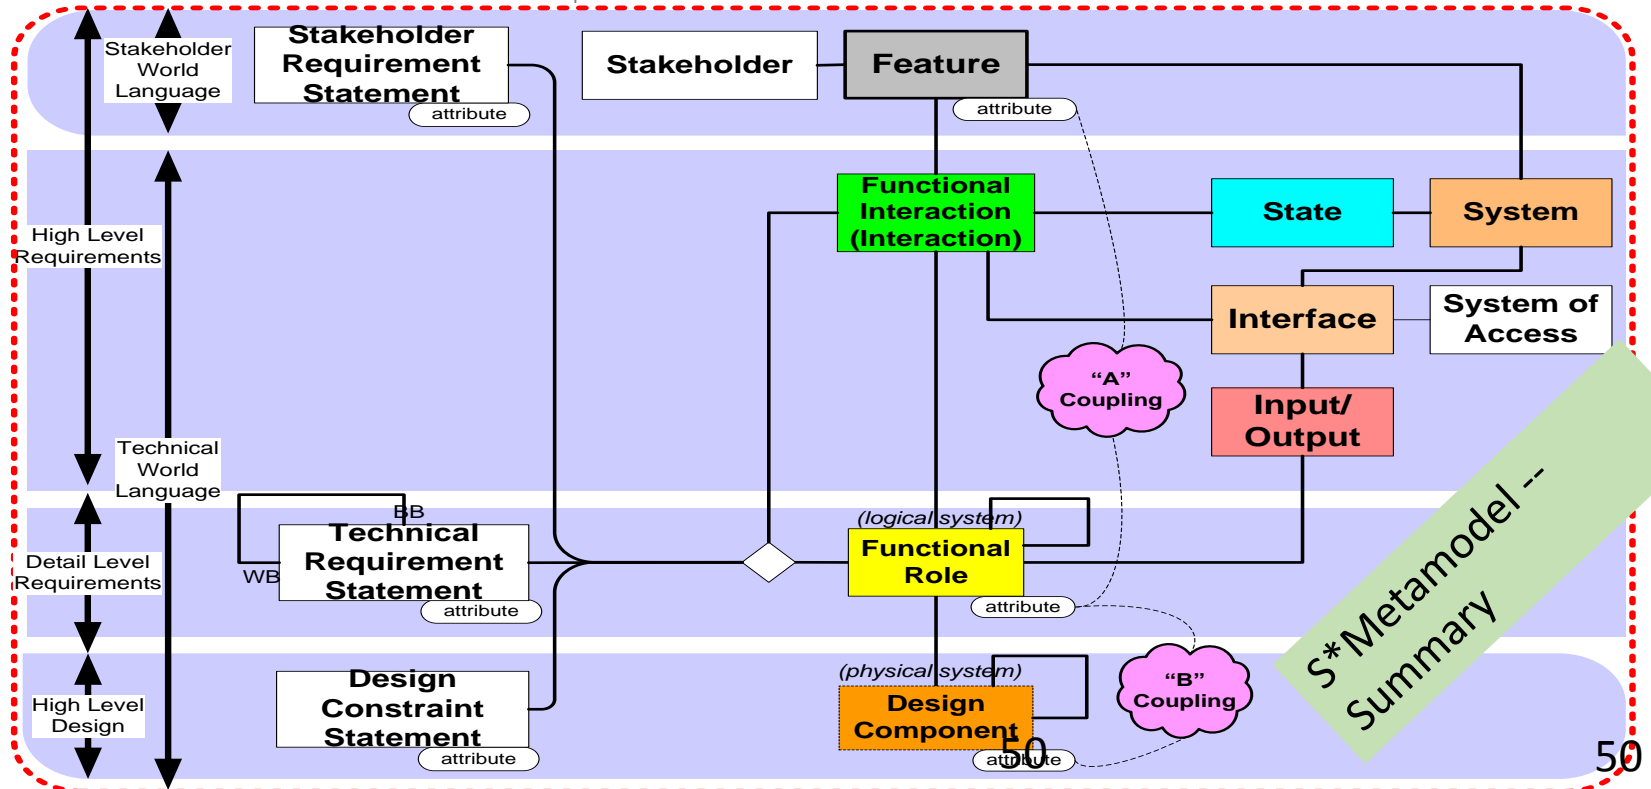

Minimality of system representations is of both theoretical and practical interest. The mathematical and scientific interest is that the size of a system's "minimal representation" is one definition of its complexity. The practical engineering interest is that the size and redundancy of engineering specifications challenge the effectiveness of systems engineering processes. INCOSE thought leaders have asked how systems work can be made 10:1 simpler to attract a 10:1 larger global community of practitioners. And so, we ask: What is the smallest model of a system?

Introduction and Background

Representation Size, Purpose, Traditions. This paper (at least) upper bounds on the sizes of effective representations in systems engineering. Compared to traditional systems engineering, directly on scientific traditions for representing behavior in engineering is still young, and its connections to supporting

Language and Compression. This subject may appear to describe systems, and an interesting thread in the mathematics whether minimality is in a sense independent of language. In any case, systems modeling languages such as SysML are valuable assets for the movement to model-based methods. The machinery of these specific modeling languages must address. When used for system families, representation described here is subject to significant compression turns out to provide powerful insights about approaches to the size of SE descriptions and processes, and about ongoing changes over time. These dynamics also suggest that such patterns in the interaction rules of the systems engineering process are

Practical representation challenges of traditional systems documentation of concept of operations (CONOP), specifications, failure mode and effects analysis (FMEA), maintenance procedures, and other task-specific system requirements can exceed thousands of pages. This does not mean

| | | | Executable Model Interoperability | The degree of interoperability of the executable model, for exchange with other environments | X | | X | | | X | | X | X |

Exercise 1: Model Planning, Targeting Business Values

1. For a (real or hypothetical) use by your enterprise of a model-based approach, configure the VVUQ Model Features Pattern to describe your targeted outcomes – use the Model Features Pattern Form.
2. Did the VVUQ Features Pattern cover all your targeted improvement issues and concerns? Are there others?
3. What model credibility issues would have to be addressed by Model VVUQ?

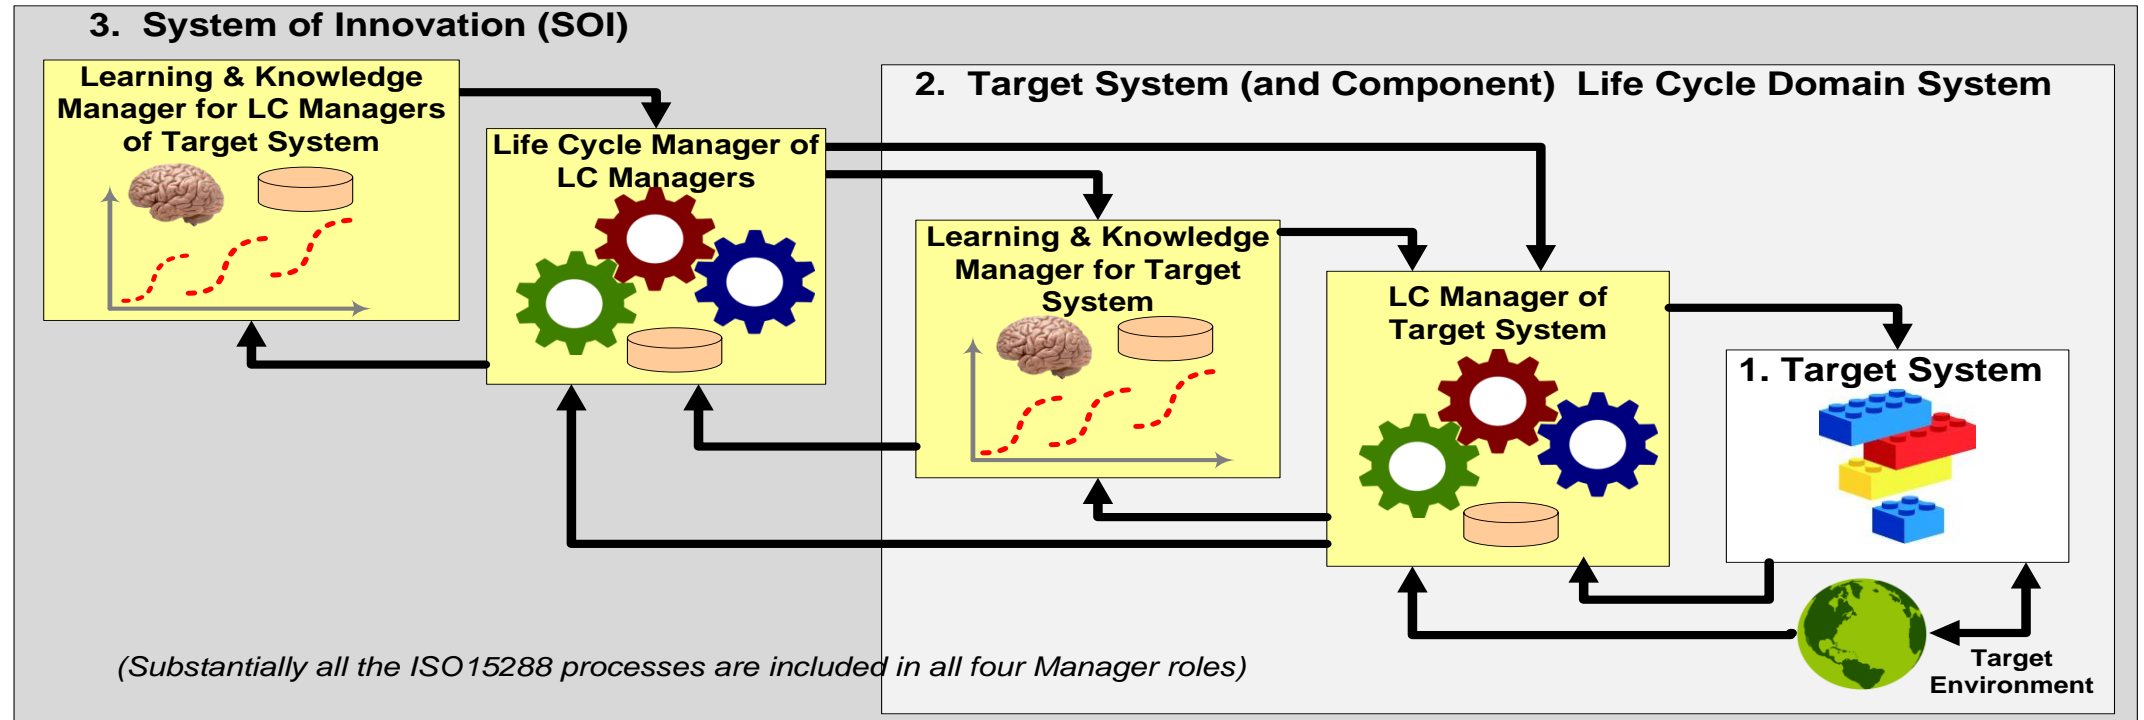

Learning, versus Lessons Not Learned

- Practical steps to improve on organizational learning, using models as a focus of organizational learning and knowledge, based on model-based Learning Systems and Autonomous Systems.

The System of Innovation (SOI) MBSE Pattern

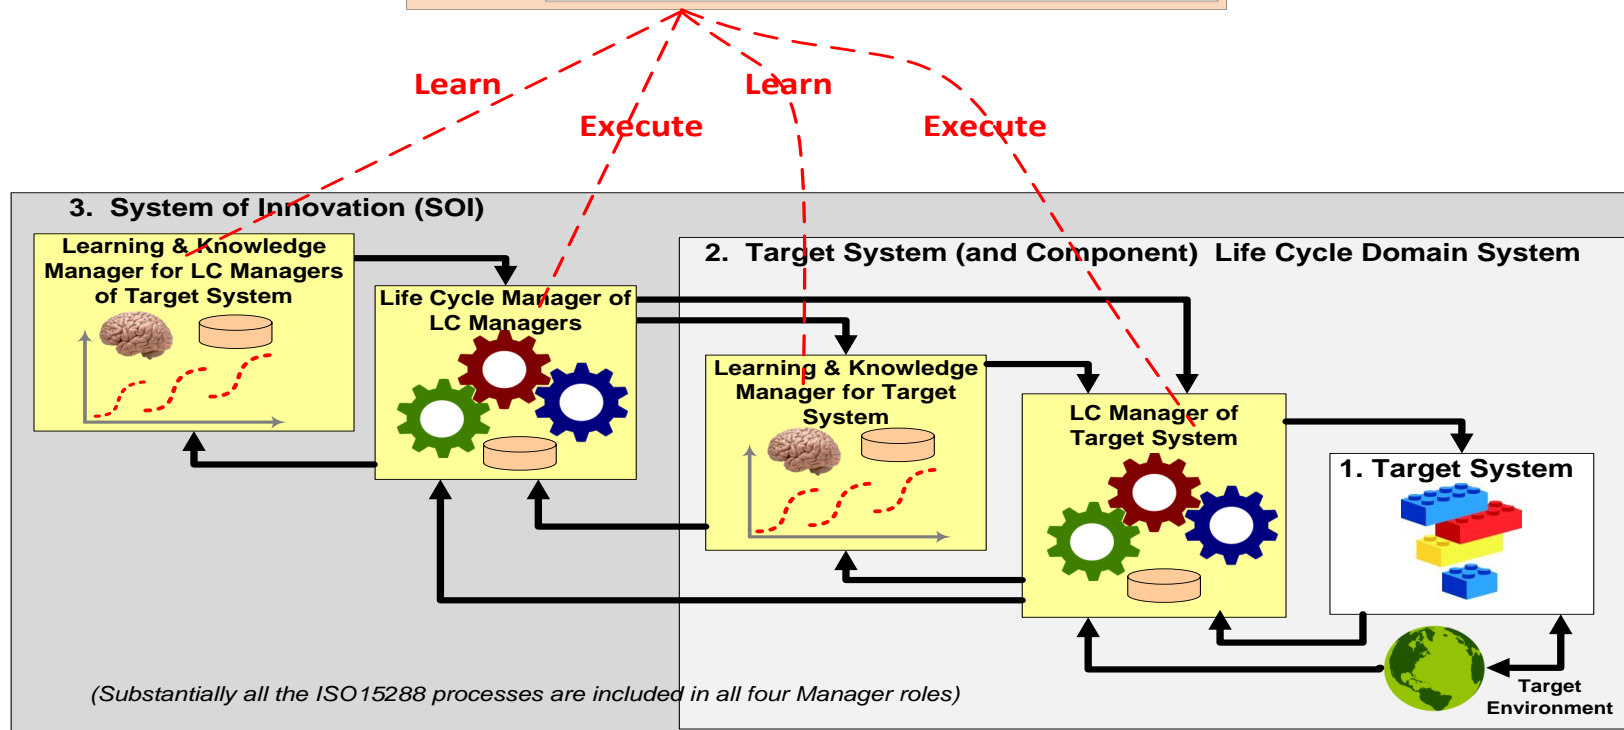

(Used for INCOSE Agile SE Project, INCOSE CIPR WG, etc.)

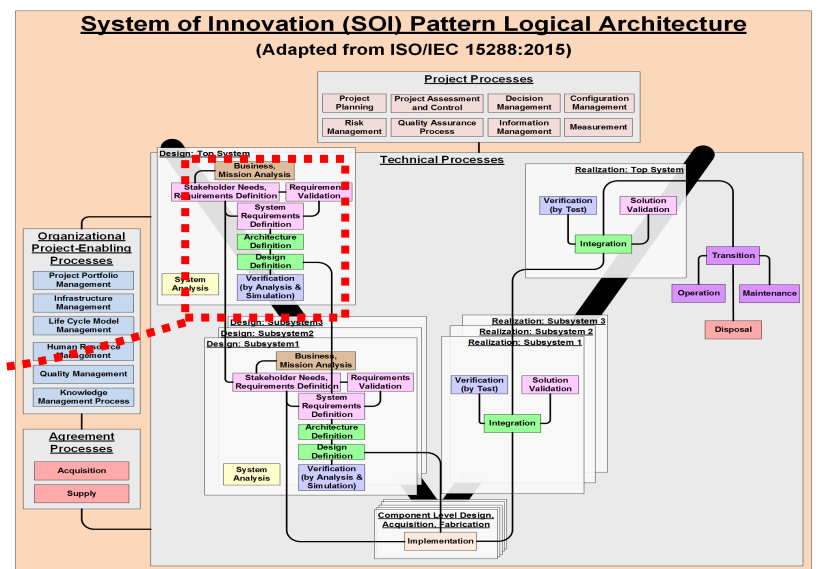

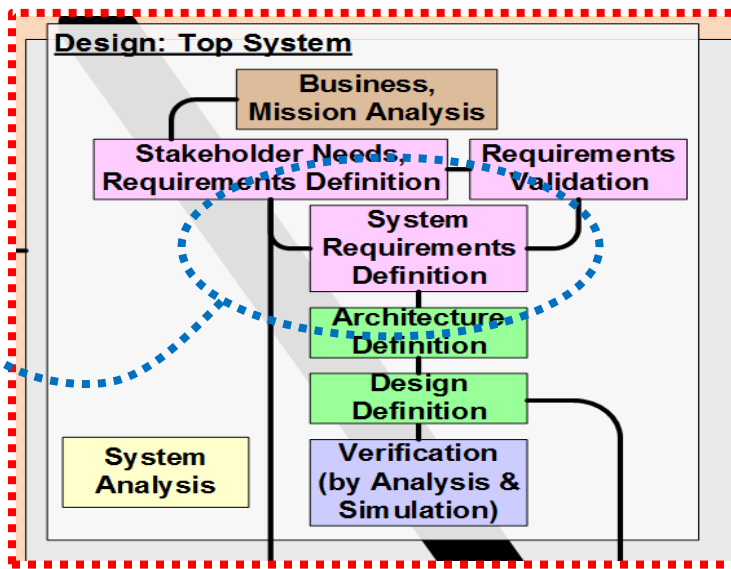

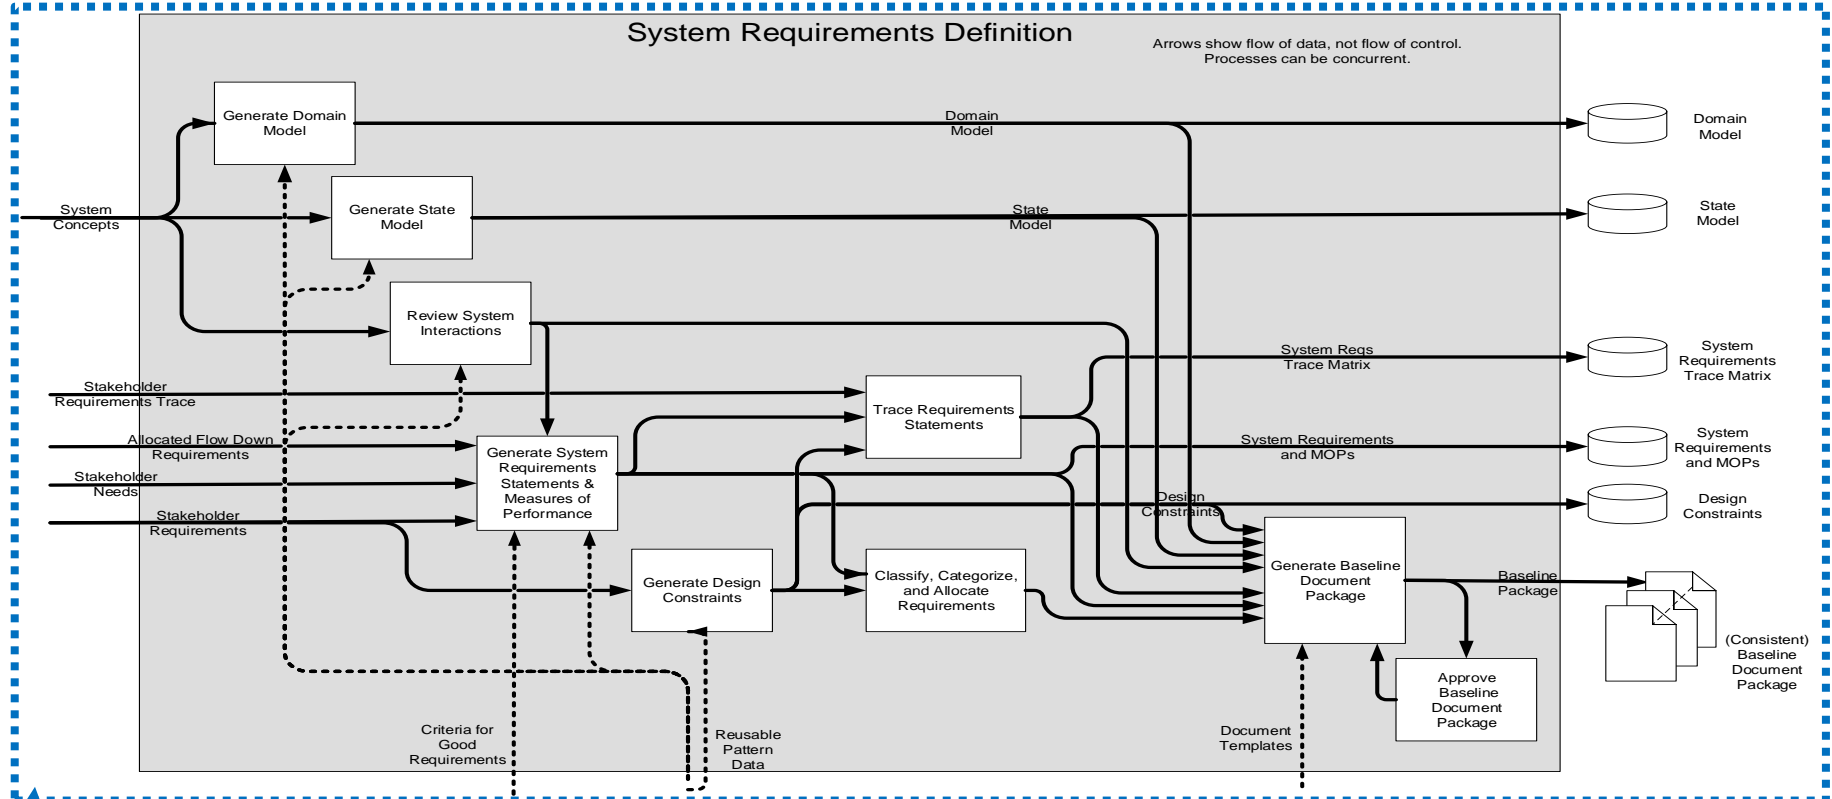

Innovation reference model: Not prescriptive, but descriptive.)

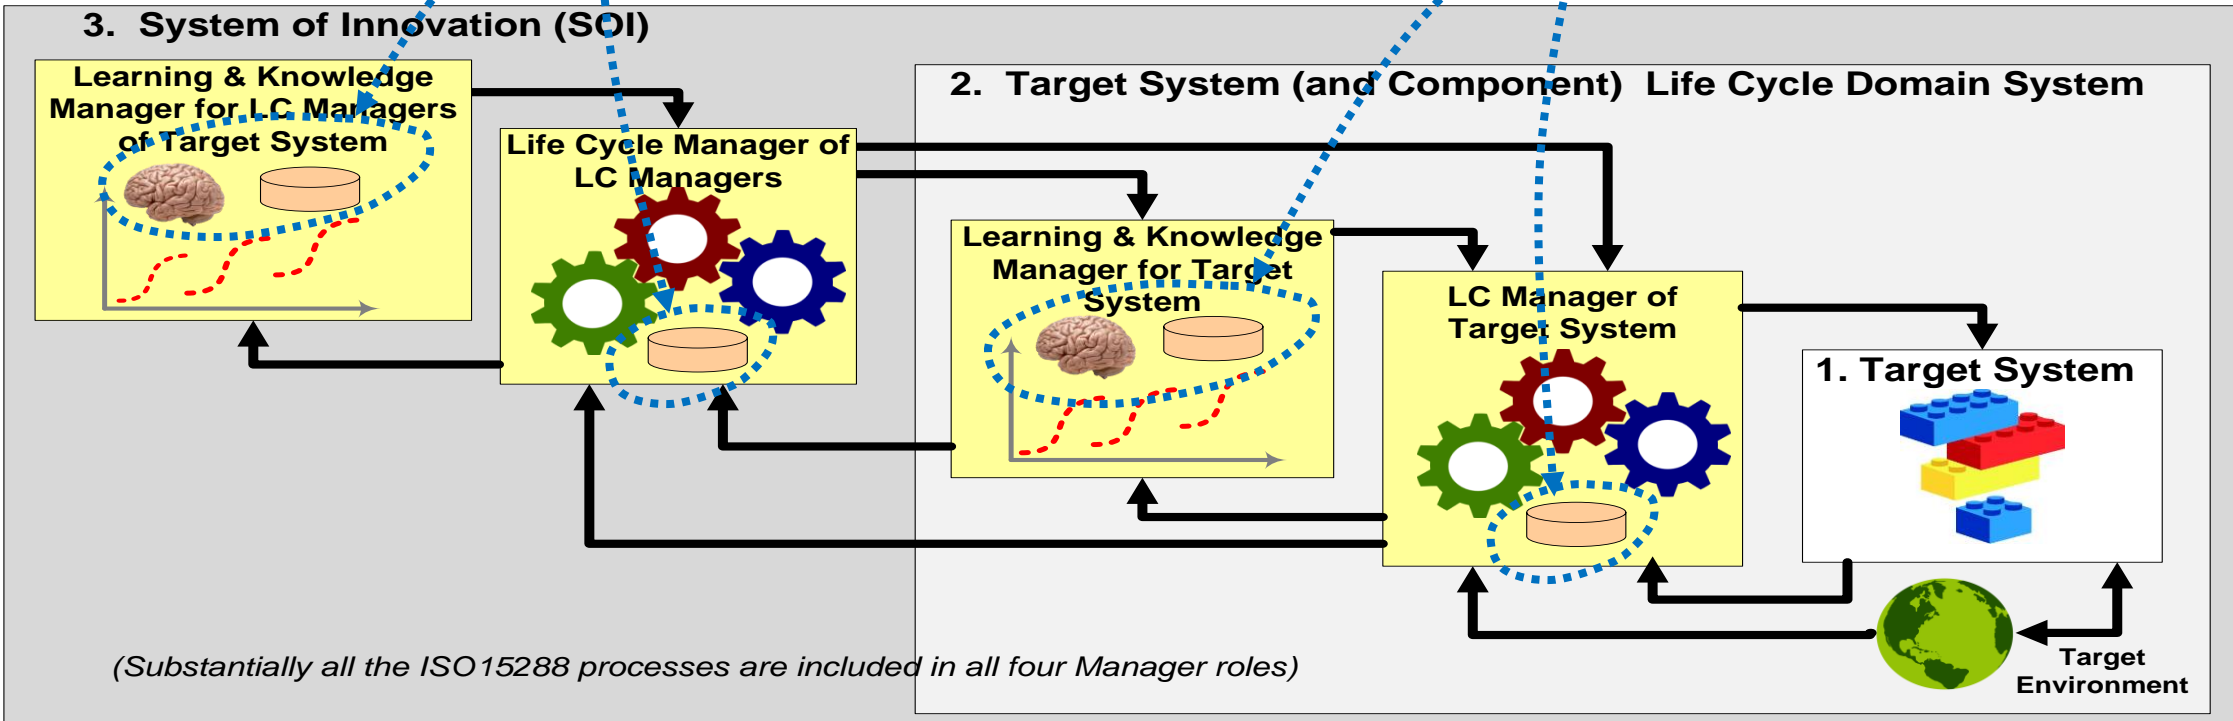

- System 1: Target system of interest, to be engineered or improved.
- System 2: The environment of (interacting with) S1, including all the life cycle management systems of S1, including learning about S1.
- System 3: The life cycle management systems for S2, including learning about S2.

ISO 15288 processes appear 4 times, whether we recognize or not.

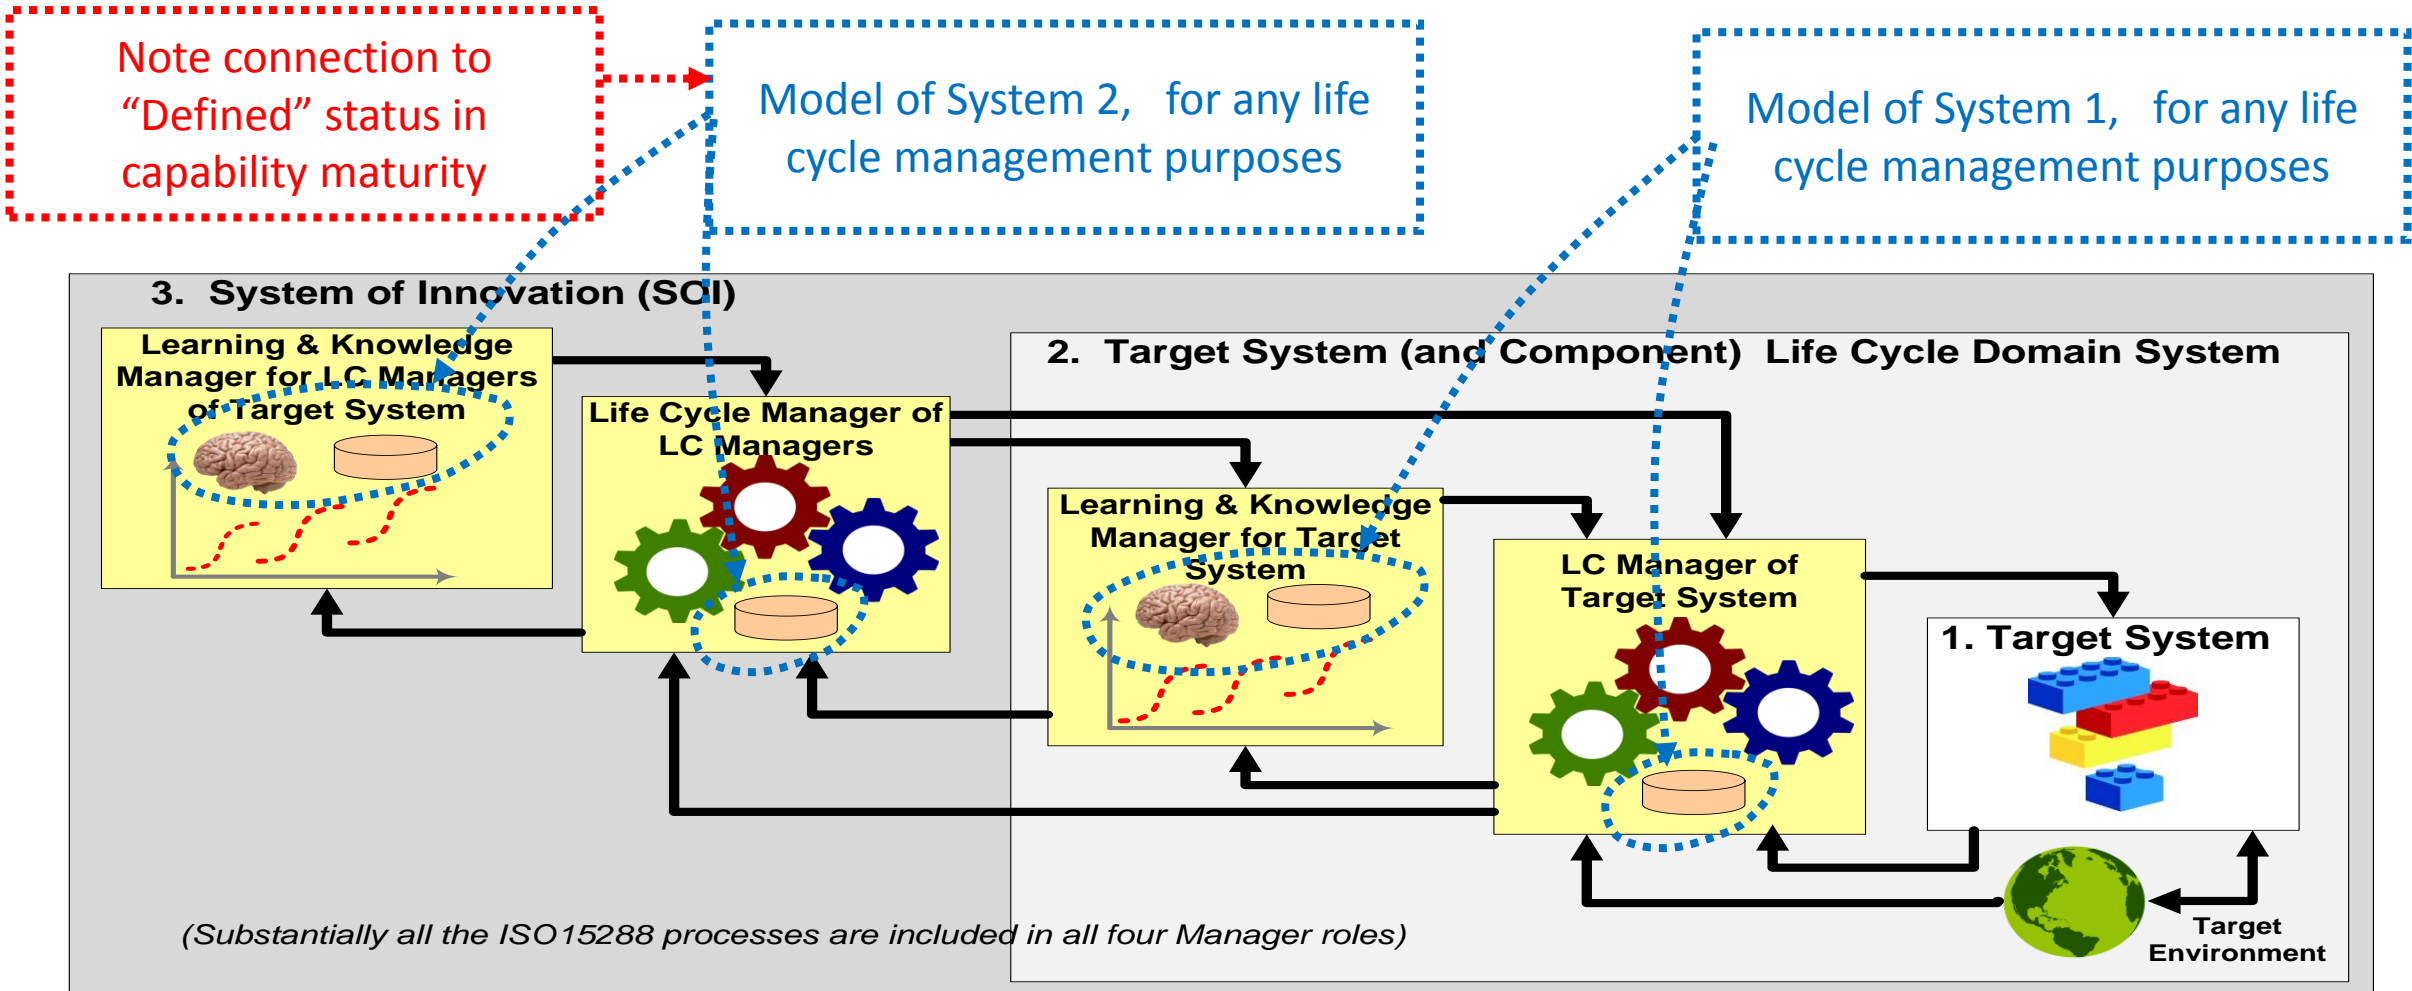

Model of System 2, for any life cycle management purposes

Model of System 1, for any life cycle management purposes

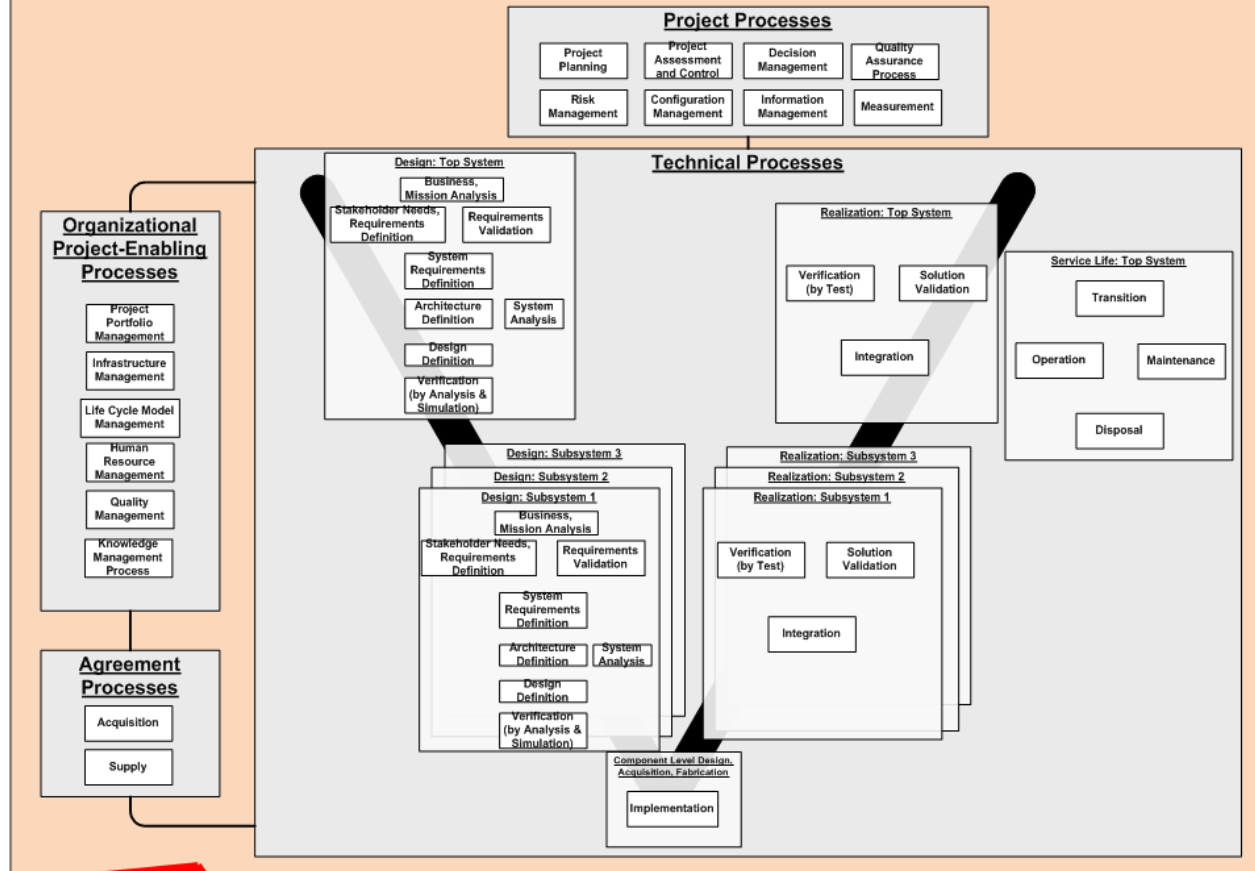

- System 1: Target system of interest, to be engineered or improved.
- System 2: The environment of (interacting with) S1, including all the life cycle management systems of S1, including learning about S1.
- System 3: The life cycle management systems for S2, including learning about S2.

- System 1: Target system of interest, to be engineered or improved.
- System 2: The environment of (interacting with) S1, including all the life cycle management systems of S1, including learning about S1.
- System 3: The life cycle management systems for S2, including learning about S2.

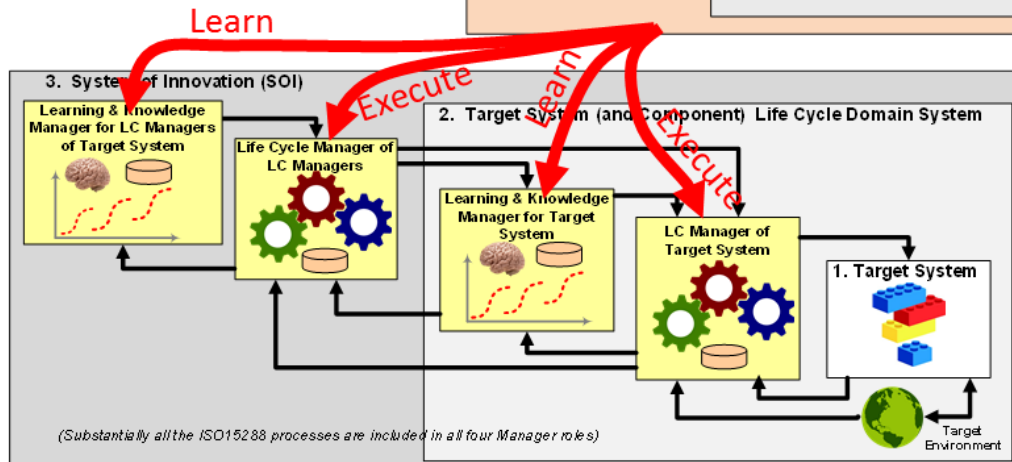

System of Innovation (SOI) Pattern Logical Architecture

(Adapted from ISO/IEC 15288:2015)

Both System 1 and System 2 are potentially subject to learning.

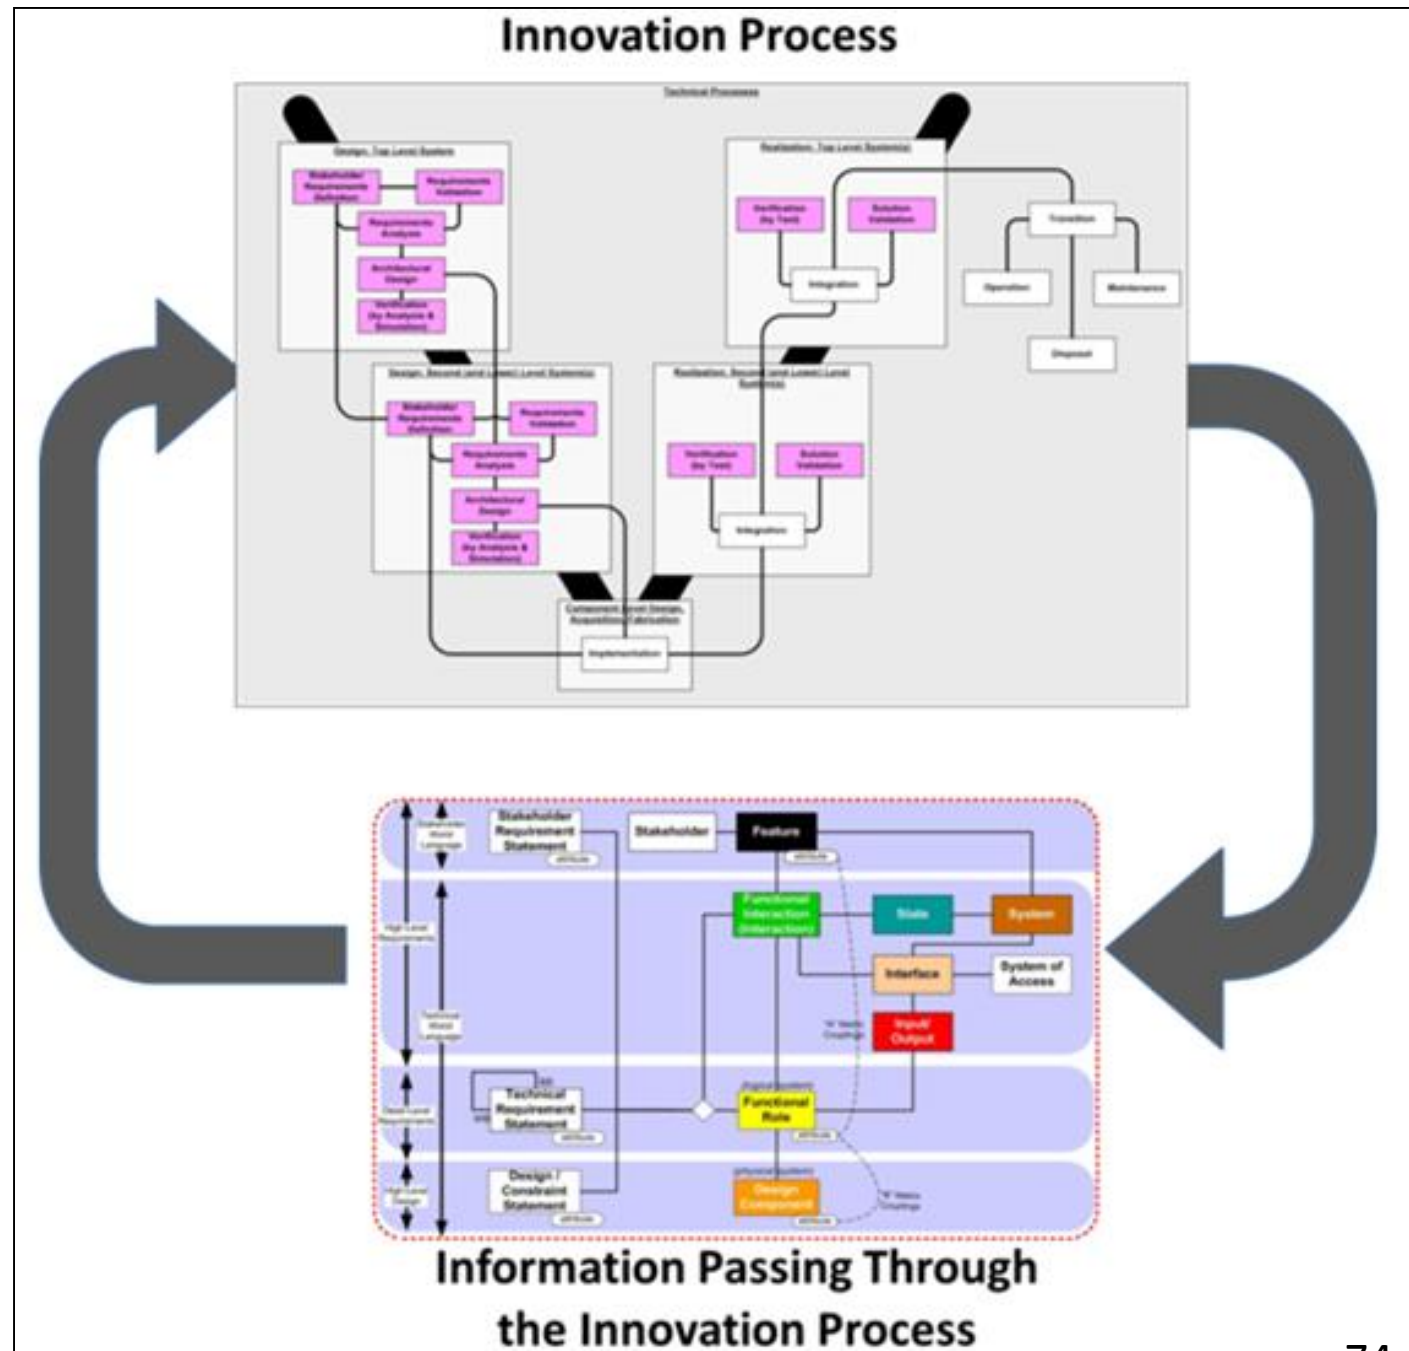

System 2: Each of the ISO15288 Processes Appears repeatedly in the ASELCM Pattern:

They appear repeatedly, in different ways in the SOI & ASELCM Patterns

From Systems Engineering to Systems Innovation:

Shifting the emphasis from traditional focus on procedure, to greater emphasis on the state of the web of information passing through the process

When is immaturity valued?

- The progressive “S Curves” of waves of new technologies, paradigms, product families, scientific, and other discoveries represent learning.
- In this context, “maturity” is the flat part at the top of each generation of learning.
- The earlier, “steep” part of the curve represents higher rates of change, as we learn more rapidly and exploit discovery.

- So, where do we want to be on this curve?
- Notice the challenging trade-off!
- Applies to learning about System 2 (e.g., methodology) as well as Learning about System 1 (engineered system).

Lessons Learned: Effective Learning?

- In many enterprises, recording “lessons learned” is institutionalized as good practice:
 - At least, at the end of a project;
 - Often, in the form of a report or memorandum to file.
- Likewise, “Knowledge Management” efforts are noted, focusing on encoding what is deemed important for future work of others.
- Measuring effectiveness of such practices:
 - Instead of how often the data is referred to, how about . . .
 - how frequently related future work that could be impacted is effectively impacted, versus repeating similar work or problem consequences.

Lessons Learned?

Lessons Learned: Effective Learning?

- Where are the “lessons learned” encoded? them to be accessed?
- Compare to biology:
 - “Muscle Memory” builds “motor” learning directly into a future situation, for future unconscious use, vs. syllogistic reasoning that may not be remembered fast enough, or at all
 - This is about “effective learning” for future agile use
 - Just having a growing file of “lessons learned”, even if text searchable, is not the same as building what we learn directly in line with the path of future related work that will have to access it in order to be executed.
- Just because we label a report “lessons learned” does not mean that those who will need this information in the future will have access to it.

What

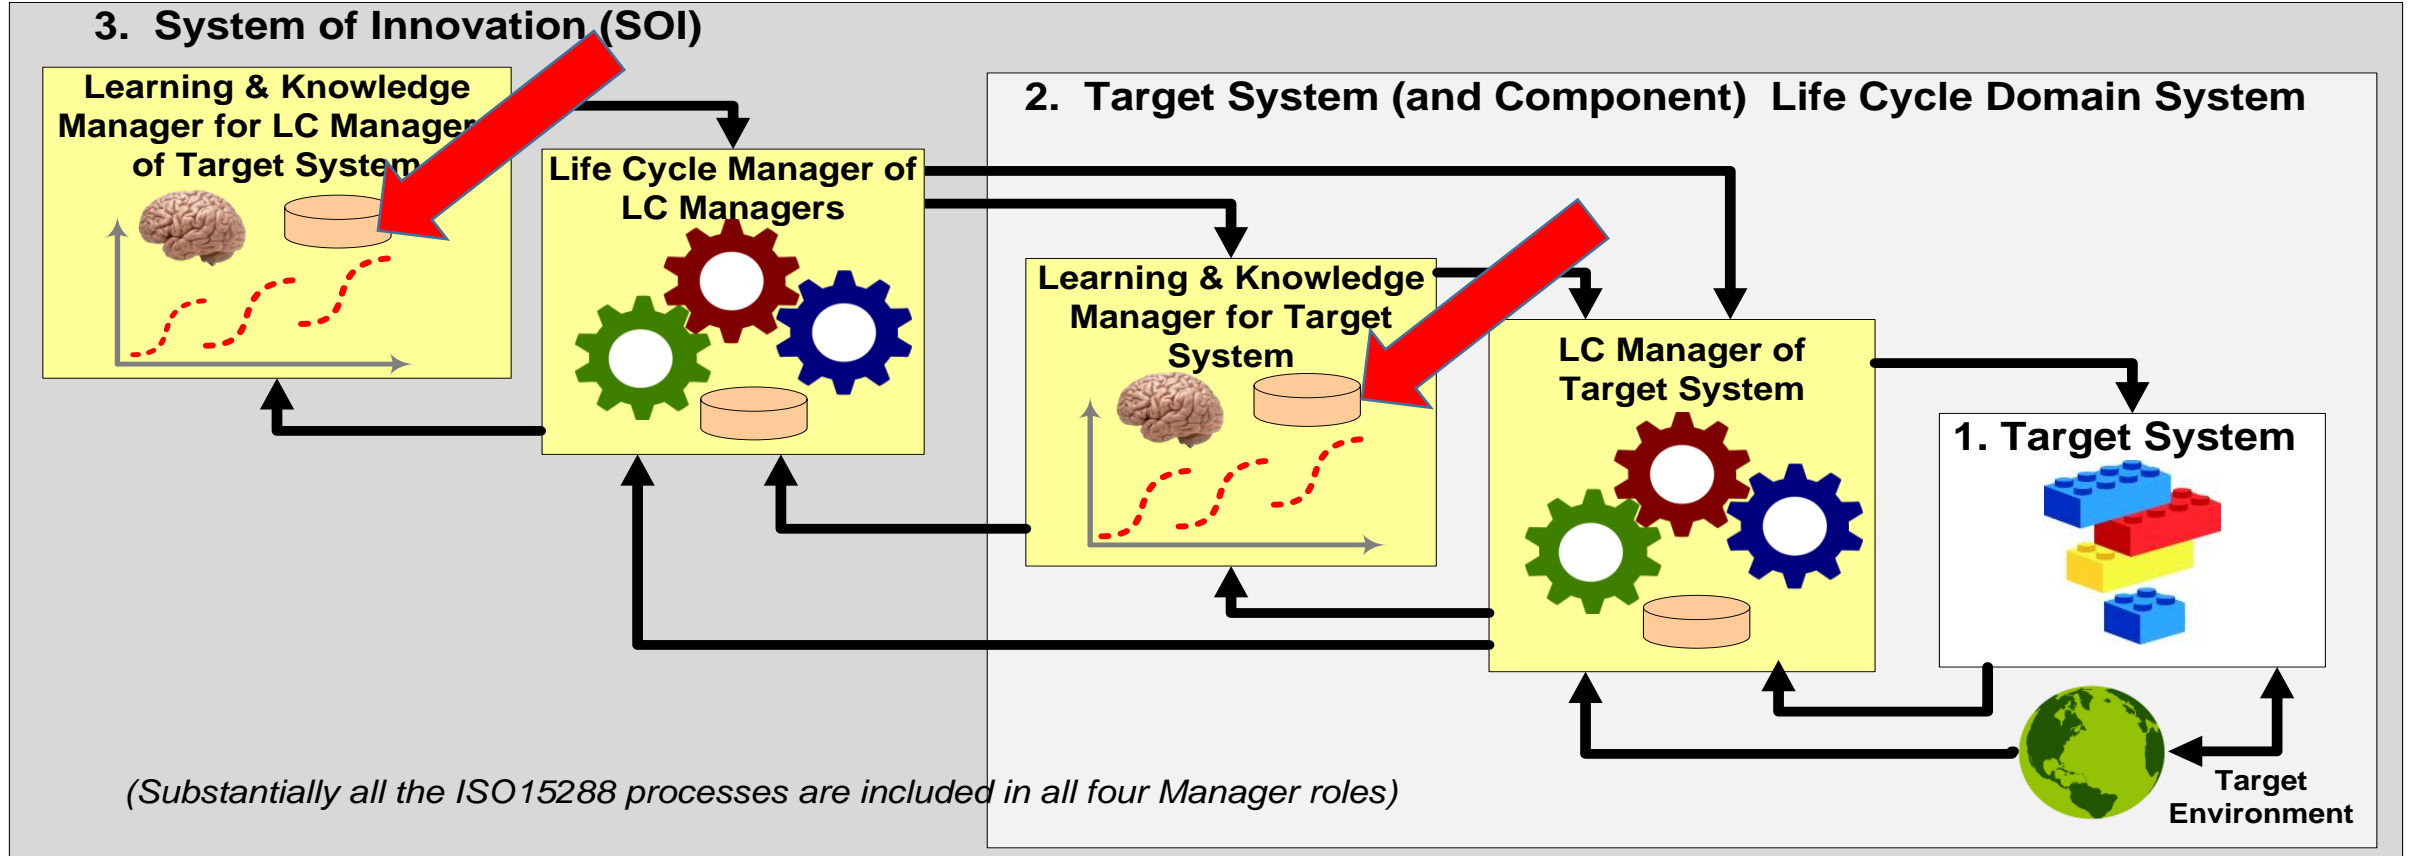

Learned models from STEM (~300 years) offer the most dramatic example of positive collaborative impact of effectively shared and validated models

- Effective Model Sharing:
 - We cannot view MBSE as mature if we perform modeling “from scratch”, instead of building on what we (*including others*) already know.
 - This is the basis of MBSE Patterns, Pattern-Based Systems Engineering (PBSE), and the work of the INCOSE MBSE Patterns Working Group.
 - S1 Patterns are built directly into future S2 project work of other people—effective sharing only occurs to extent it impacts future tasks performed by others.
 - This sharing may occur across individuals, departments, enterprises, domains, markets, society.
 - It applies not only to models of S1 (by S2), but also models of S2 (by S3).
- Effective Model Validation:
 - Especially when shared, models demand that we trust them.
 - This is the motivation for Model Validation, Verification, and Uncertainty Quantification (Model VVUQ) being pursued with ASME standards committees.
 - Effectiveness of Model VVUQ is essential to MBSE Maturity.
 - Because Model VVUQ adds significantly to the cost of a trusted model, MBSE Patterns are all the more important—they IP of enterprises, industries.

An emerging special case: Regulated markets

- Increasing use of computational models in safety-critical, other regulated markets is driving development of methodology for Model VVUQ:
 - See, for example, ASME V&V 10, 20, 30, 40, 50, 60.
- Models have economic advantages, but the above can add new costs to development of models for regulatory submission of credible evidence:
 - Cost of evidentiary submissions to FDA, FAA, NRC, NTSB, EPA, OSHA, when supported by models—includes VVUQ of those models.
- This suggests a vision of collaborative roles for engineering professional societies, along with regulators, and enterprises:
 - Trusted shared MBSE Patterns for classes of systems
 - Configurable for vendor-specific products
 - With Model VVUQ frameworks lowering the cost of model trust for regulatory submissions
- Further emphasizes the issue of trust in models . . .

An emerging special case: Regulated markets

- Trusted shared MBSE Patterns for classes of systems
- Configurable for vendor-specific products
- With Model VVUQ frameworks lowering the cost of model trust for regulatory submissions

Exercise 2: Targeted Learning Areas

1. Identify and list the opportunities in your enterprise and process to capture what is learned in system patterns used as the basis of future projects.
2. Which are System 1 and which are System 2?

Can You Trust Someone Else's Model? Your Model?

- Planning for Model Verification, Validation, and Uncertainty Quantification (Model VVUQ)

R.W. Russell – Ex Nihilo Systems

Requirements for trustable models

We cannot discuss maturity in development or use of models without discussing whether we can trust those models . . .

If we expect to use models to support critical decisions, then we are placing increased trust in models:

- Critical financial, other business decisions
- Human life safety
- Societal impacts
- Extending human capability

- MBSE Maturity requires that we characterize the structure of that trust and manage it:
 - The Validation, Verification, and Uncertainty Quantification (VVUQ) of the models themselves.

What is meant by VVUQ of a model?

- Model Validation (V)
- Model Verification (V)
- Model Uncertainty Quantification (UQ)
- Not just for numerical grid (FEA, CFD, Thermal) models—
extension to system models at all levels.
- Bayesian Network aspects of UQ

V&V of Models, Per Emerging ASME Model V&V Standards

Does the Model adequately describe what it is intended to describe?

Model Validation

Model validated?

Model verified?

Model Verification

Does the Model implementation adequately represent what the Model says?

Describes Some Aspect of

V&V of Systems, Per ISO 15288 & INCOSE Handbook

Do the System Requirements describe what stakeholders need?

System Validation

Requirements validated?

Design verified?

System Verification

Don't forget: A model (on the left) may be used for system verification or validation (on the right!)

Quantitative Fidelity, including Uncertainty Quantification (UQ)

- There is a large body of literature on a mathematical subset of the UQ problem, in ways viewed as the heart of this work.
- But, some additional systems work is needed, and in progress, as to the more general VVUQ framework, suitable for general standards or guidelines.

General structure of uncertainty / confidence tracing:

- Do the modeled external Interactions qualitatively cover the modeled Stakeholder Features over the range of intended S1 situations of interest?
- Quantify confidence / uncertainty that the modeled Stakeholder Feature Attributes quantitatively represent the real system concerns of the S1 Stakeholders with sufficient accuracy over the range of intended situation envelopes.
- Quantify confidence / uncertainty that the modeled Technical Performance Attributes quantitatively represent the real system external behavior of the S1 system with sufficient accuracy over the range of intended situation envelopes.

Related ASME activities and resources

- ASME, has an active set of teams writing guidelines and standards on the Verification and Validation of Computational Models.
 - Inspired by the proliferation of computational models (FEA, CFD, Thermal, Stress/Strain, etc.)
 - It could fairly be said that this historical background means that effort was not focused on what most systems engineers would call “system models”
- Also conducts annual Symposium on Validation and Verification of Computational Models, in May.
- To participate in this work, in 2016 the speaker joined the ASME VV50 Committee:
 - With the idea that the framework ASME set as foundation could apply well to systems level models; and . . .
 - with a pre-existing belief that system level models are not as different from discipline-specific physics models as believed by systems community.
- Also invited sub-team leader Joe Hightower (Boeing) to address the INCOSE IW2017 MBSE Workshop, on our related ASME activity.

ASME Verification & Validation Standards Committee

- V&V 10: Verification & Validation in Computational Solid Dynamics
- V&V20: Verification & Validation in Computational Fluid Dynamics and Heat Transfer
- V&V 30: Verification and Validation in Computational Simulation of Nuclear System Thermal Fluids Behavior
- V&V 40: Verification and Validation in Computational Modeling of Medical Devices
- V&V 50: Verification & Validation of Computational Modeling for Advanced Manufacturing
- V&V 60: Verification and Validation in Modeling and Simulation in Energy Systems and Applications

Requirements for trustable, impactful models, as a basis for MBSE maturity

MBSE Maturity in general, and VVUQ for Models in particular, mean we have to understand:

- Stakeholders for Models
- Stakeholder Features of Models
- Technical Requirements for Models
- We are capturing these in an MBSE Pattern

INCOSE MBSE Assessment and Planning Pattern

Opportunities--what you can do

- Think larger about intended uses and users of MBSE, and judge its maturity in that light.
- Include how well MBSE enables group learning.
- Include the full breadth of model types in your thinking.
- Consider why you think a model should be trusted.
- Join the INCOSE MBSE Patterns Working Group, to advance practice.
- Join the ASME Computational VVUQ effort, to advance model trust.
- Exercise the emerging MBSE Planning and Assessment Framework, in your own company and work, and provide feedback.

Exercise 3: Identifying Credibility Needs for Trusted System Patterns

1. Where and when, in your enterprise organization and process, could a trusted system pattern be consulted as the basis for configuring system Requirements, Designs, Failure Analysis, Manufacturing, Distribution, Support, or otherwise?
(Hint: Consider your answers to Exercise 2.)
2. What would be the model credibility issues that would need to be addressed? What could be the benefits of a trustable model?

You are here.
