INTEGRATED PROJECT
ENGINEERING CONGRESS

A Criticality Framework for Resilient Communications Networks – INCOSE Telecommunications Working Group

- Thomas Manley (Downer Defence Systems) • Susan Ronning (ADCOMM Engineering LLC) • William Scheible (MITRE Corporation)
- Dr Keith Rothschild (Cox Communications)

PRESENTED BY

College of
Leadership &
Management

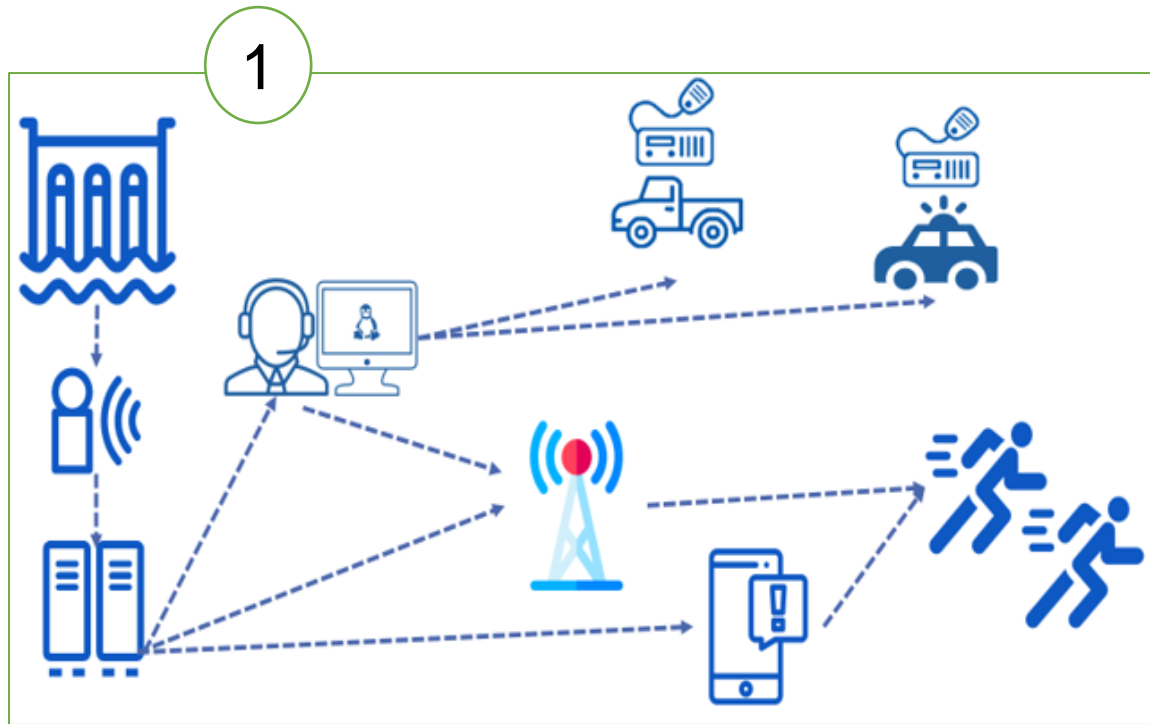

Example: Communications Networks?

Example:

Emergency medical call from mobile phone service via commercial telephone system to public safety answering point to ambulance via voice radio and broadband data networks – This demonstrates multi-bearer networks in everyday occurrence

Example: Communications Networks

Example:

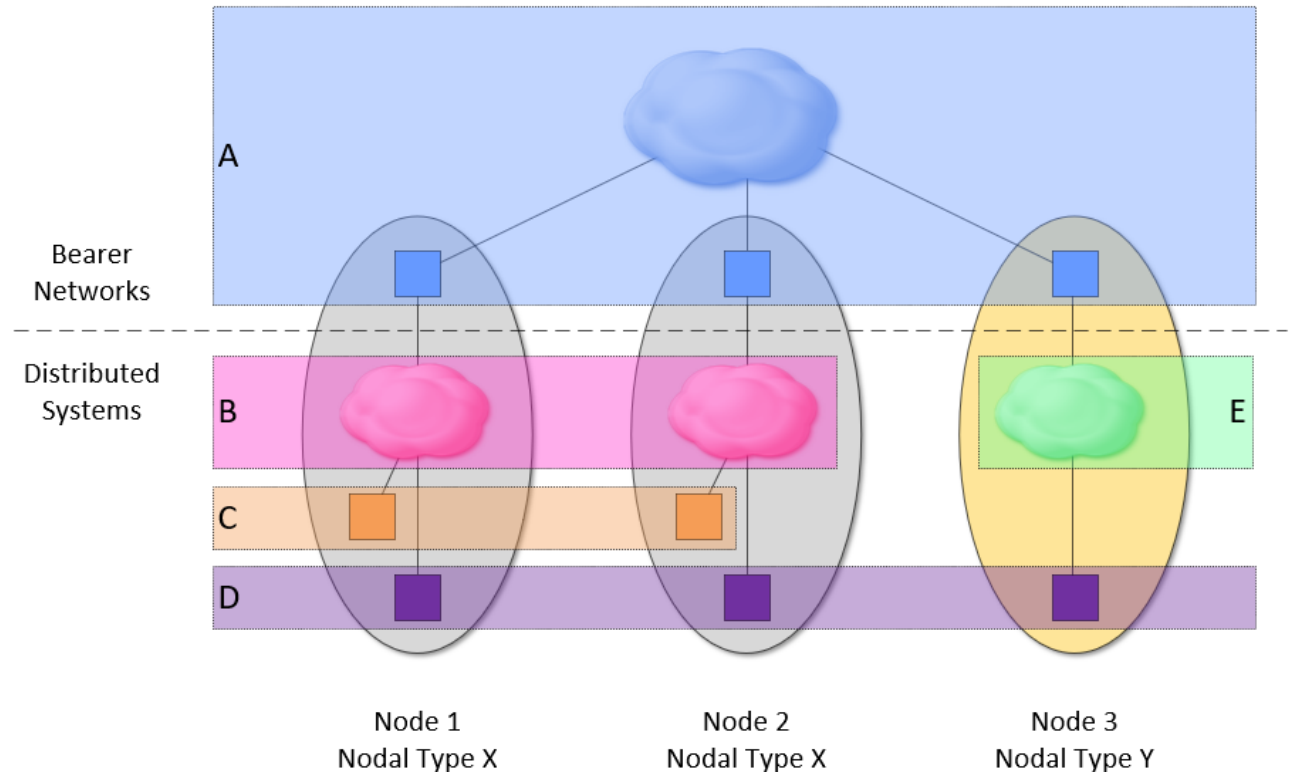

1. Dam breach flood warning system (alerts: operations department, work crews, the public)
2. Two-way radio system (public safety, utilities, transportation, etc.)

- A CN may actually be made up of a collection of contributing CNs, integrated and interacting with one another (each acting as an independent system)
- A CN may therefore be owned, maintained, and managed by different entities, all working together to transport critical information from one location to another
- Each individual system – independently and together – must be designed to withstand potential failures.

- Just like Information Technology (IT), **telecommunications** is *typically* **NOT a CORE business function**
- Communications networks **support** the core business
- *Old circuit-based* Operational Technology (OT) systems are converging with *new IP networks*
- **Telecommunications practitioners** must support the networks and systems

- Policy makers, account managers, and business operators:
 - must apply funds appropriately to ensure the critical services are prioritized.
- System designers:
 - must consider potential adverse conditions to ensure reliable and resilient services.

- **Bearer Networks** – those functional systems whose main purpose is to connect nodes, for example, a WAN
- **Distributed Systems** – systems whose elements operate together irrespective of geographical distribution, or are at least managed as one system

- **Inside Looking Out** – the perspective of the carrier (network provider)
- **Outside Looking In** – the perspective of the enterprise (service/application)
