Lubricant (Oil) Filter Product Family

Walk-through of next segments of S*Patterns

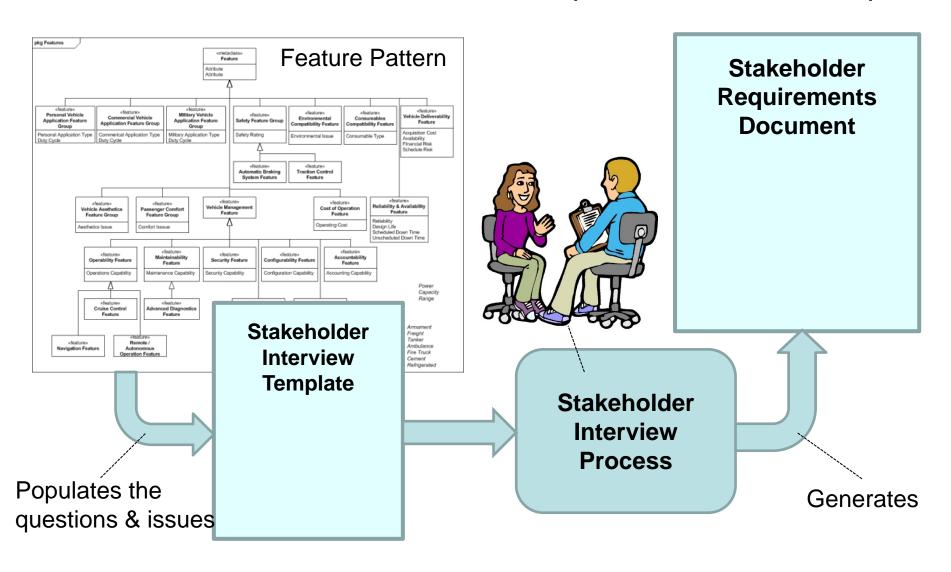

- Any discussion or question areas for current Wave 1 patterns?
 - _
 - _
 - _
 - ___
- If you are new to this team, background available at:
 - General S*PBSE methodology tutorial and papers downloads, through link at bottom of team web site:
 - http://www.omgwiki.org/MBSE/doku.php?id=mbse:patterns:patterns
 - Past team meeting minutes and meeting materials, through meeting links in "Schedule" table at middle of team web site:
 - http://www.omgwiki.org/MBSE/doku.php?id=mbse:patterns:patterns

Walk-through of next segments of S*Patterns

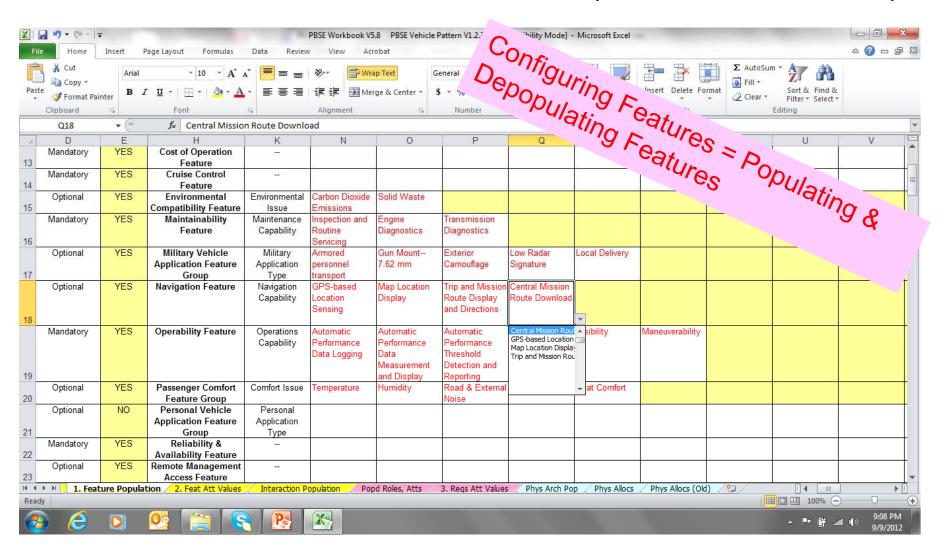

The Pattern Configuration Process

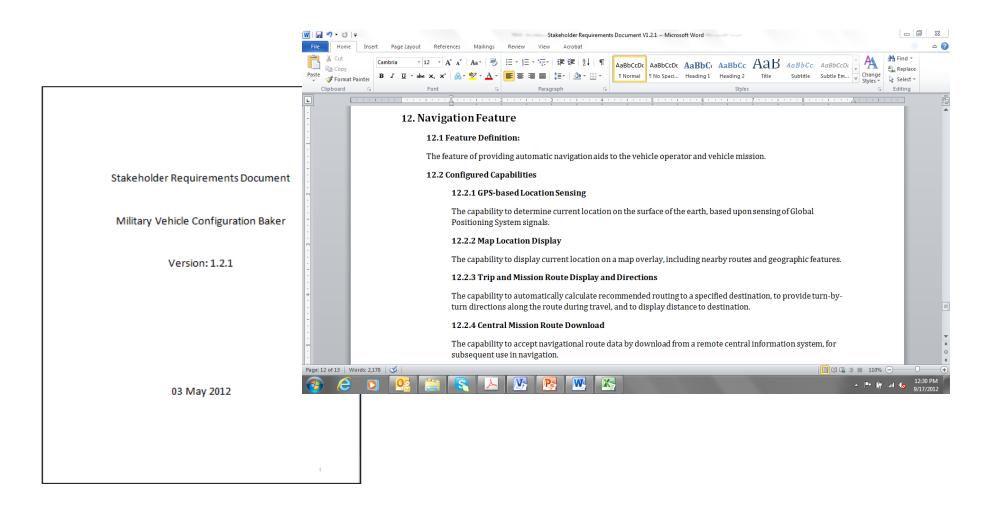

Using the Feature Pattern to Rapidly Capture & Validate Stakeholder Requirements: An Example

1. Using the Feature Pattern to Rapidly Capture & Validate Stakeholder Requirements: An Example

1. Using the Feature Pattern to Rapidly Capture & Validate Stakeholder Requirements: An Example

Using the Feature Pattern to Rapidly Capture Validate Stakeholder Requirements

Benefits:

- A more complete set of stakeholder requirements—reduce omissions;
- Stronger alignment with stakeholders, sooner—surface issues earlier;
- Pattern identifies classes of stakeholders that might have been missed;
- Pattern makes very clear the difference between Stakeholder
 Requirements versus Design Constraints or Technical Requirements;
- The Pattern provides a clear place to accumulate new learning (e.g., additional Features);
- Sets up subsequent uses of Feature Pattern in support of Trade Space,
 Risk Management, and other applications.

No free lunch:

- Interviewer needs to be knowledgeable about the Features;
- Stakeholders won't have all the answers—find the right representative;
- Stakeholder representatives need know they are formal representatives;
- The Feature Pattern needs to be relatively complete.

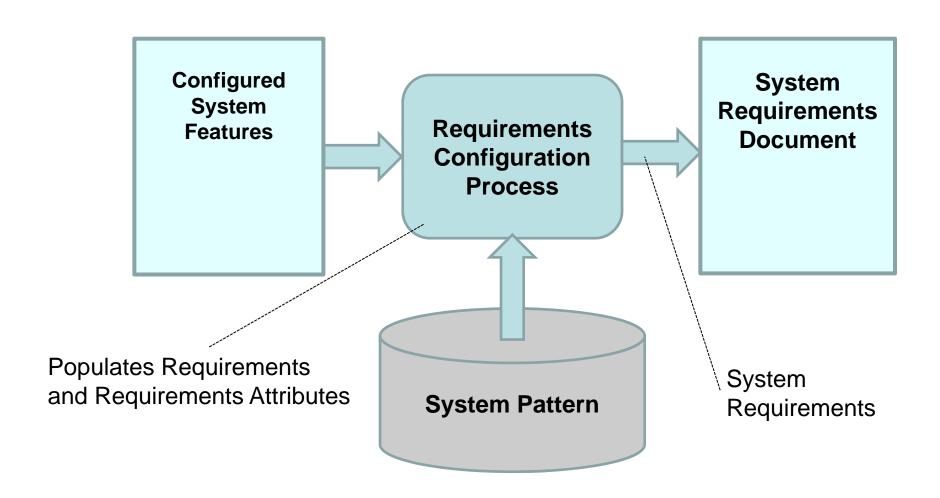

How do I know whether I have all the Features?

- This is why we use a Pattern!
 - Moves problem to the builder of the original pattern.
- Related key points for the builder of the Feature Pattern:
 - First, identify all the Stakeholder classes
 - Then, all the Features for each Stakeholder class
 - Validate the Features with their Stakeholders
 - Then, make sure all the Interactions are reviewed for associated Feature value
 - There are well-known abstract Feature classes (e.g., Maintainability)
- Every time we discover another Feature, we add it to the Pattern; for example:
 - Every argument / decision should invoke trade space Features as its ultimate rationale – a new one might appear during an argument.
 - Every impactful Failure Mode should cause Feature impacting Effects a new one might appear while discussing a Failure Mode.

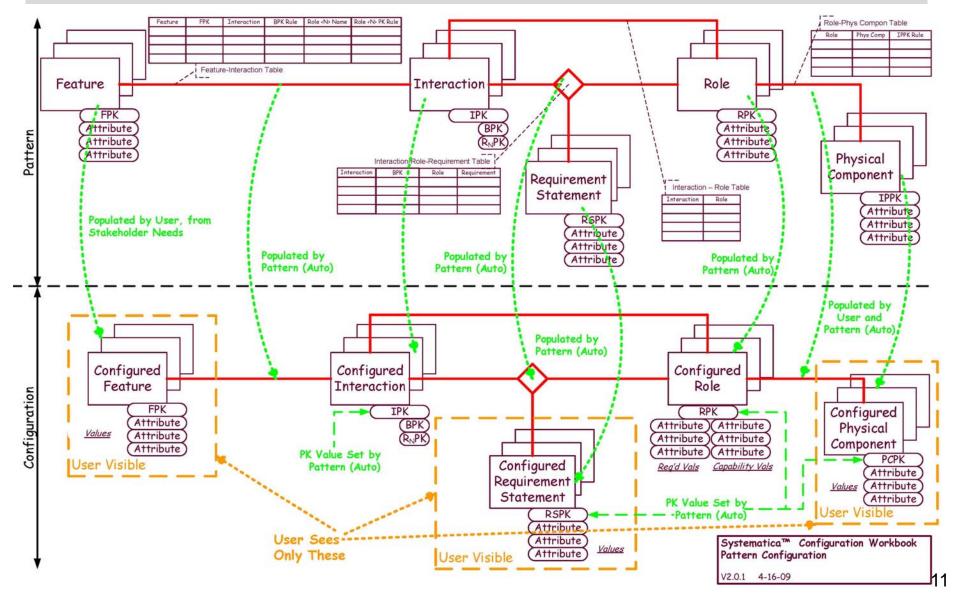

2. Using Pattern Configuration to generate better System Requirements faster: Example

- Concept: Configured System Requirements can be semiautomatically generated from Configured Features, using the System Pattern;
- Low dimensionality / degrees of freedom choices in Feature stakeholder space imply higher dimensionality / degrees of freedom choices in Requirements space:
 - The difference is made up by relationships encoded in the Pattern.

2. Using Pattern Configuration to generate better System Requirements faster: Example

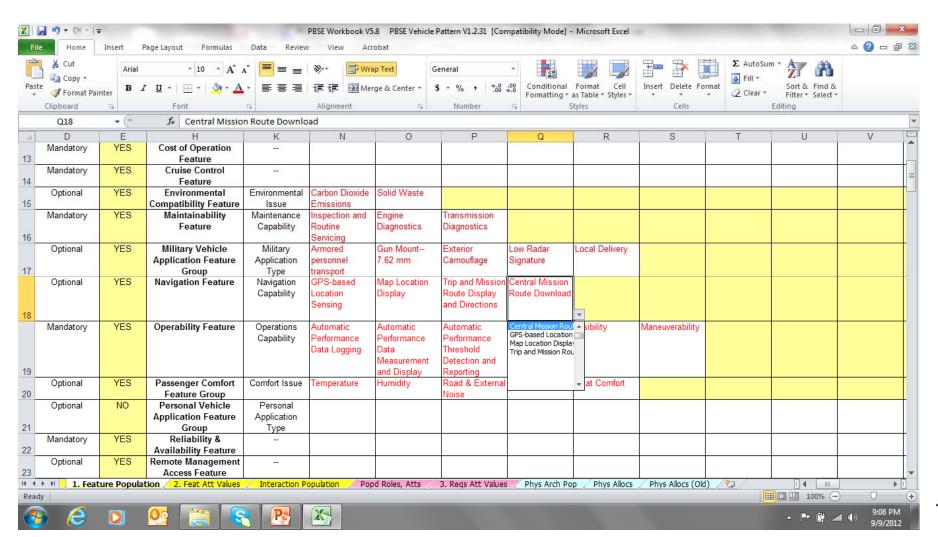

- The S*Pattern links Features to Requirements:
 - This means that populating a configuration of Features can automatically populate a configuration of Requirements--

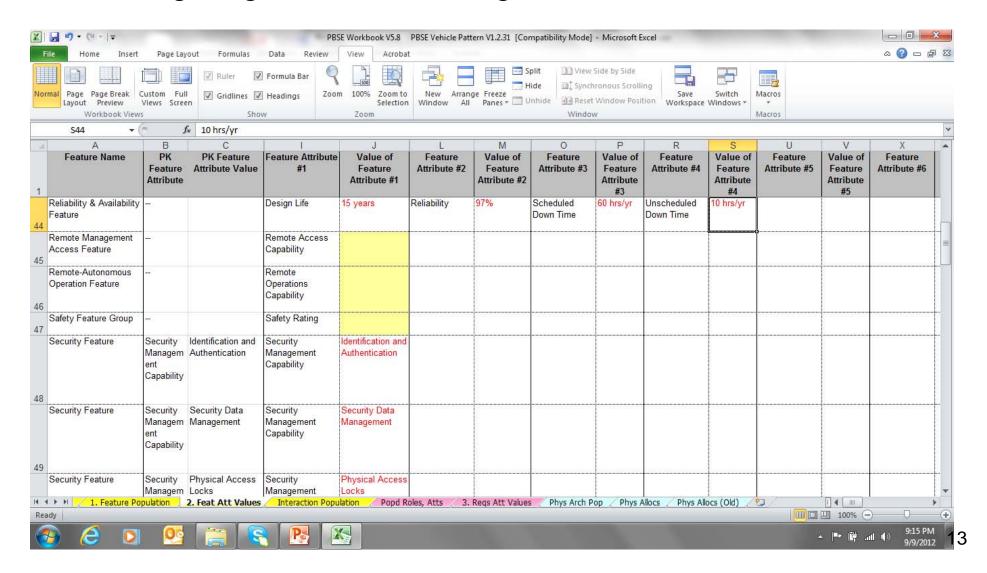

2. Using the Feature Pattern to Rapidly Capture & Validate Stakeholder Requirements: An Example

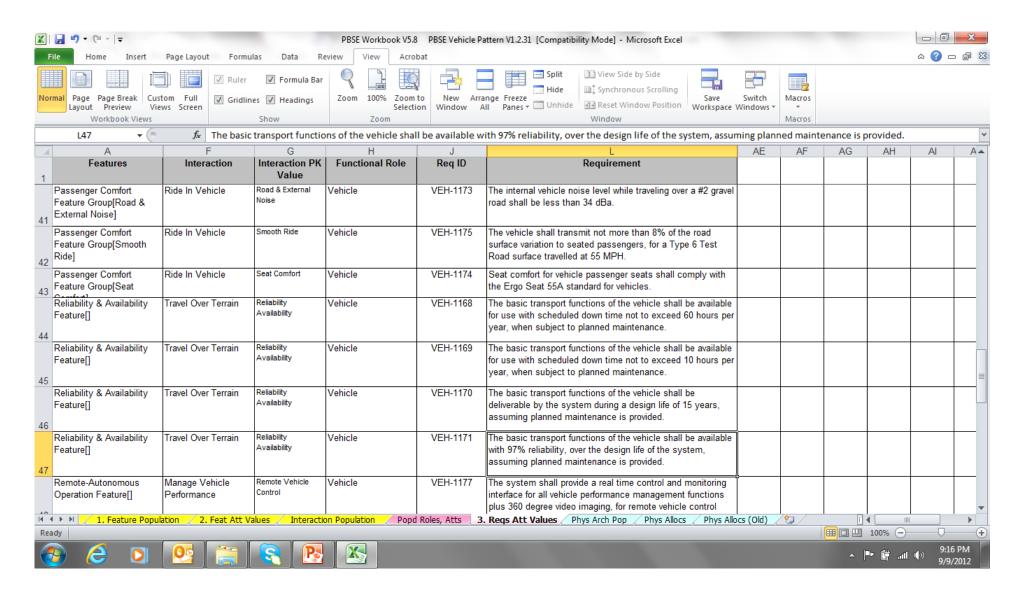

Populating / depopulating Features:

2. Using the Feature Pattern to Rapidly Capture & Validate Stakeholder Requirements: An Example

Configuring Features: Setting Feature Attribute Values

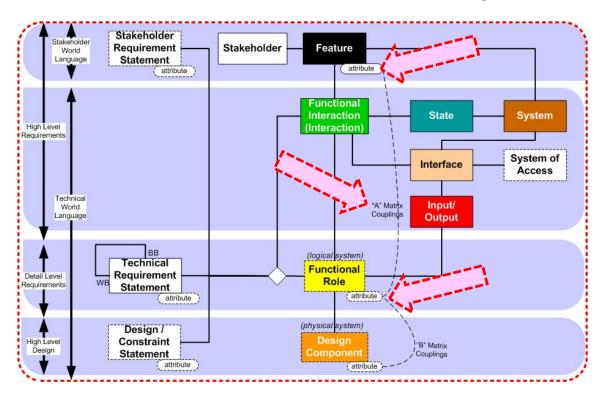

Resulting Requirements:

Attribute values can also be set, in line or in tables

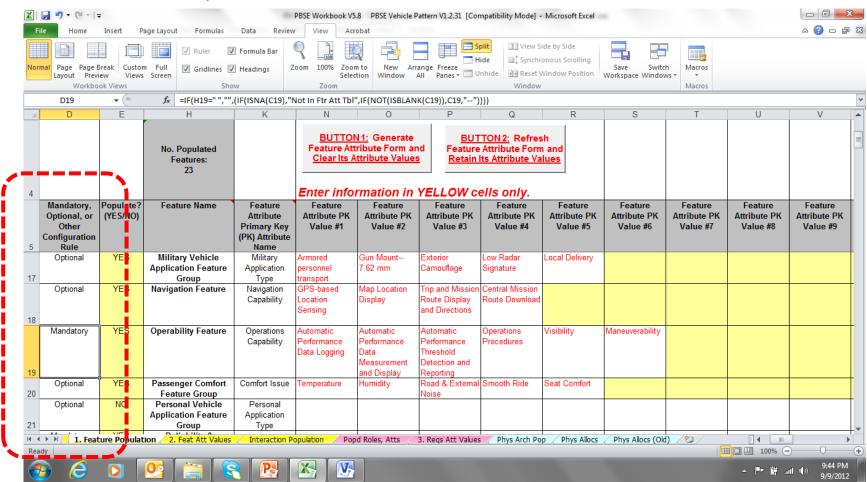

2. Using Pattern Configuration to generate better System Requirements faster: Example

- Requirements Attribute Value Setting:
 - A part of the configuration process
 - Example: Cruise Control Speed Stability
 - In PBSE, requirements attribute value setting can be manual, semiautomatic, or automatic—in all cases, driven by Feature Attribute Values and Attribute Couplings:

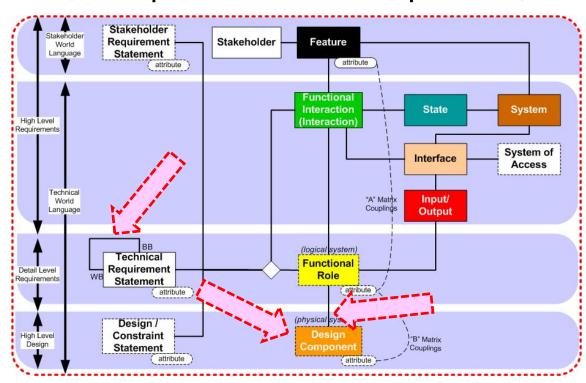

2. Using Pattern Configuration to generate better System Requirements faster: Example

In general, Configuration Rules are found in the Relationships that associate the model Classes, and also those that associate the model Attributes:

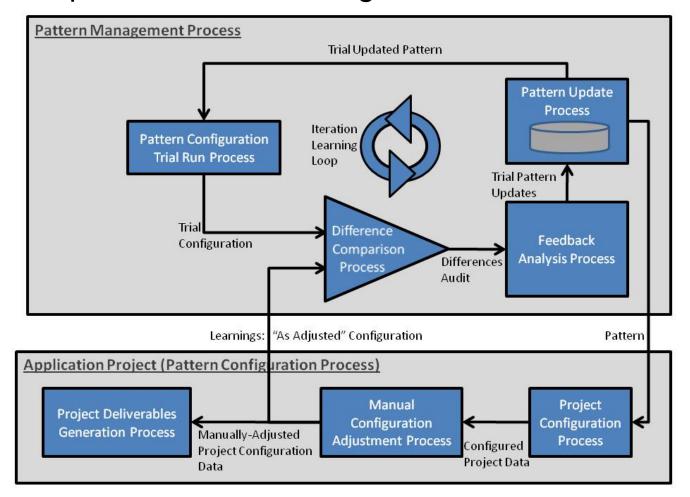

2. Using Pattern Configuration to generate better System Requirements faster

- The scope of a System Pattern can include more than Requirements:
 - Design Patterns include Physical Architecture,
 Requirements Decomposition, Requirements Allocations:

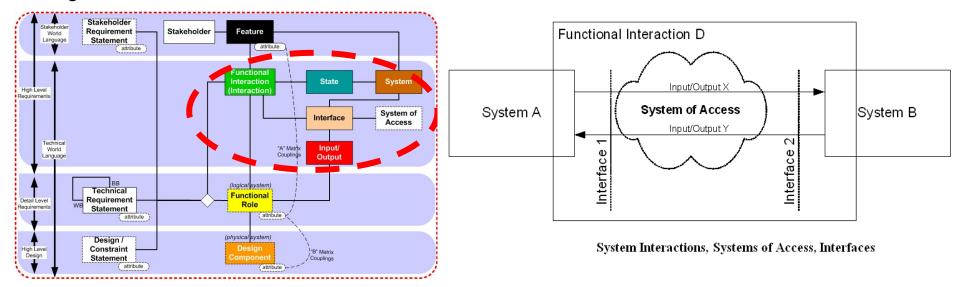

2. Using Pattern Configuration to generate better System Requirements faster

 PBSE processes continuously improve the content of the pattern, accumulating lessons for use in future projects:

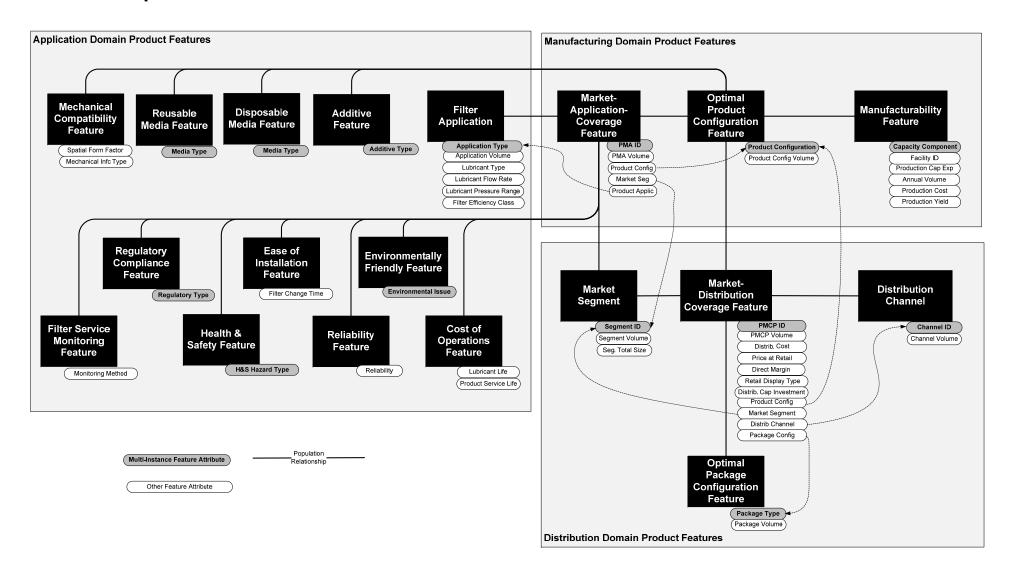

Walk-through of some initial S*Pattern segments

- <u>Functional Interaction</u>: Physical interactions, in which energy, force, mass, or information is exchanged between components. Can occur when the system is in a particular State.
- <u>Input-Output</u>: Energy, Force, Mass, or Information exchanged during Interactions.
- <u>Interface</u>: An association of a System (which has the interface), a set of Input-Outputs (which flow through the interface), a set of Interactions (which describe behavior at the interface), and a System of Access (which provides the external medium of interaction).
- **System of Access**: An external system providing an external medium of interactive exchange.
- <u>State</u>: Modes, Phases, Situations, having duration in time, during which some Interactions are eligible to occur and others are not.

Once we establish a Pattern for a Platform or Product Line System, specific configurations are generated by selection (population) of Features, and setting values for Feature Attributes.

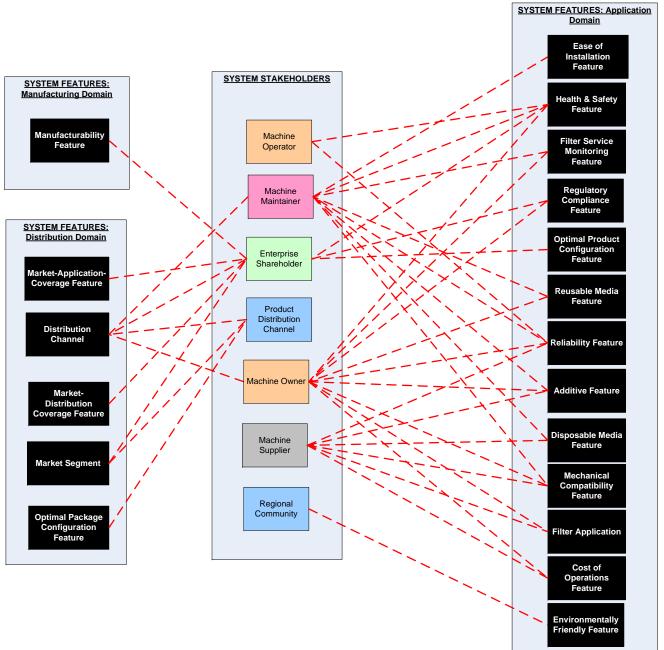

Example S*Pattern Stakeholder Feature Overview Model

Example S*Pattern Stakeholder Feature Model Extract

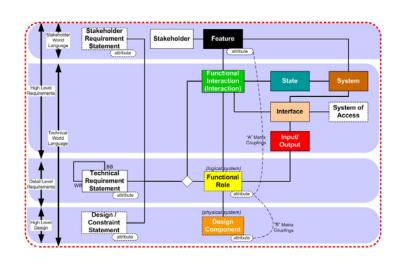

Feature	Feature Attribute	Multi- Instance	Attribute Definition	Attribute Units	Attribute Values
Optimal Product Configuration Feature	Product Configuration	X	Identifies the configuration of the product, as a model ID. Multiple configurations may be populated.	N/A	
Optimal Product Configuration Feature	Product Configuration Volume		The number of units of this product configuration produced per year.	Units/Year	
Filter Application	Application Type		The type of lubricated system application supported by a lubricant filtration system. More than one type may be instantiated for a single product configuration.		Consumer Automotive, Commercial Automotive, Fixed Base Engine System, Harsh Environment, High Temperature Environment, Cold Environment
Filter Application	Application Volume		The number of units of this application placed into service during a year.	Units/Year	
Filter Application	Lubricant Type		The type of lubricating fluid to be used.	N/A	
Filter Application	Lubricant Flow Rate		The rate at which the lubricating fluid must be circulated in order to meet equipment lubrication objectives.	GPM	High, Medium, Low
Filter Application	Lubricant Pressure Range		The amount of hydraulic pressure under which the lubricant will circulate.	PSI	High, Medium, Low
Filter Application	Filter Efficiency Class		The profile of filtration efficiency provided by the filter	N/A	
Mechanical Compatibility Feature	Spatial Form Factor		The class of three dimensional structure of a component, subsystem, or space within a system reserved for a component or subsystem.	N/A	
Mechanical Compatibility Feature	Mechanical Interface Type	1	The mechanical class of the interface between the oil filter and the equipment to which it is connected.	N/A	
Cost of Operation Feature	Lubricant Life		The amount of time that a lubricant is intended to operate, meeting requirements within the specified environment, before it is replaced.	Hours	

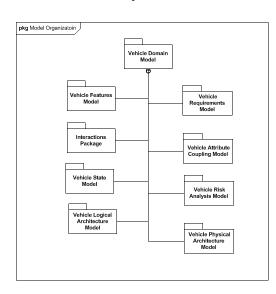

Example S*Pattern Stakeholder Feature Overview Model

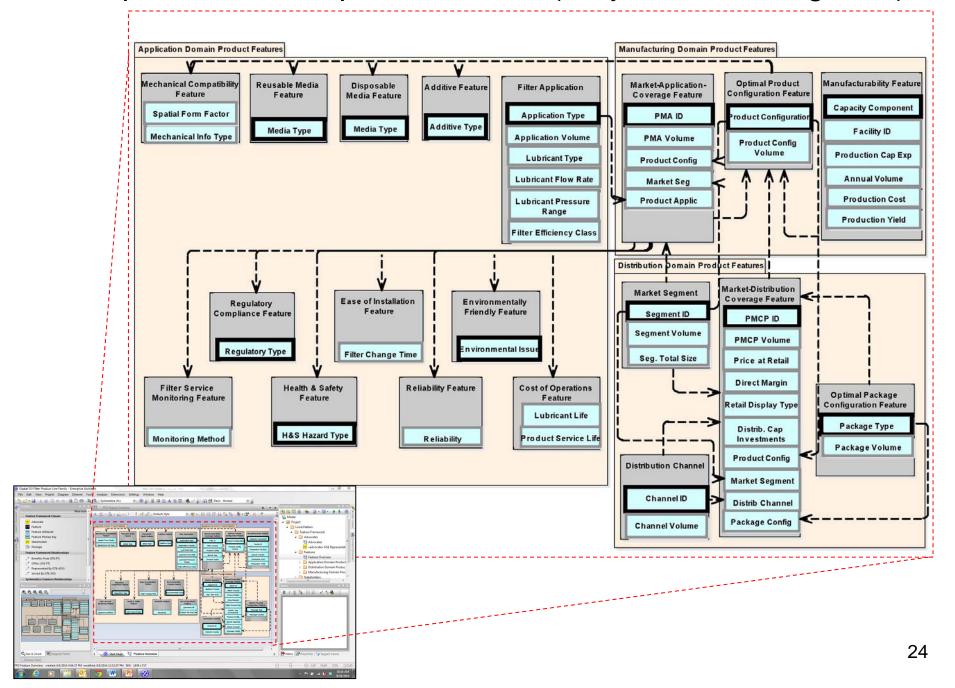

What modeling tools, languages will we use?

- S*Metamodel is modeling language independent:
 - Readily expressed in SysML or other modeling languages.
 - For INCOSE work, if the sub-team does not have a conflicting goal, we'd encourage use of SysML, familiar to more in INCOSE.
 - Be prepared to learn a few things that the modeling language standards have not quite caught up with yet.
 - One of our team's spin-offs is feedback to Sandy Friedenthal's inputs on future SysML releases.
 - If you have a different language in mind, we'll help.

Examples from Enterprise Architect (a SysML Modeling Tool)

	Enterprise Shareholder	Machine Maintainer	Machine Operator	Machine Owner	Machine Supplier	Product Distribution Channel	Regional Community
Additive Feature		Î		Î	Î		
Cost of Operations Feature				Î			
Disposable Media Feature		Î		Î	Î		
Distribution Channel	Î	Î		Î		Î	
Ease of Installation Feature		Î					
Environmentally Friendly Feature							Î
Filter Application				Î	Î		
Filter Service Monitoring Feature		Î		Î			
Health & Safety Feature		Î	Î	Î			
Manufacturability Feature	Î						
Market-Application-Coverage Feature	Î

External "domain model" for System of Interest

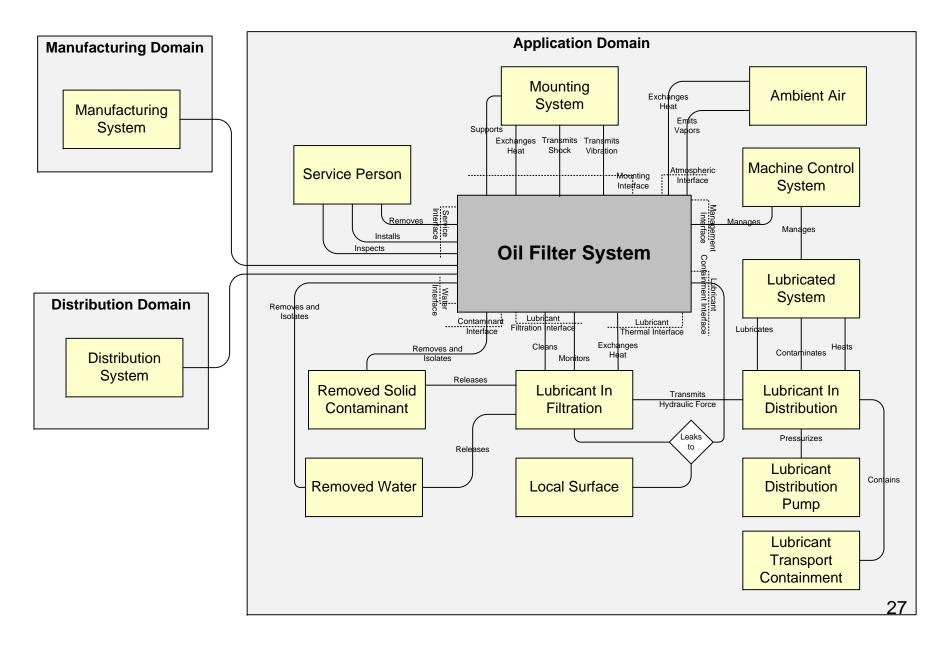

- Will later help us identify all the external interactions with System of Interest.
 - So what? All system black box requirements are identified with (may be discovered through) those interactions.
- Domain diagram shows Actors, Interfaces, Input-Outputs or Relationship--:
 - Actors: People or other Systems that directly interact with the system of interest, by exchanges of force, energy, mass, or information.
 - <u>Input-Outputs</u>: The exchanged forces, energy, mass, or information.
 - Domain Architecture Relationships: Alternative way to summarize inputoutputs

 Interfaces: Associations of Systems (that "have" the interfaces), Input-Outputs (that "pass through" the interfaces), Interactions (that "describe behavior" at interfaces, and Systems of Access (that provide the external media of

interaction).

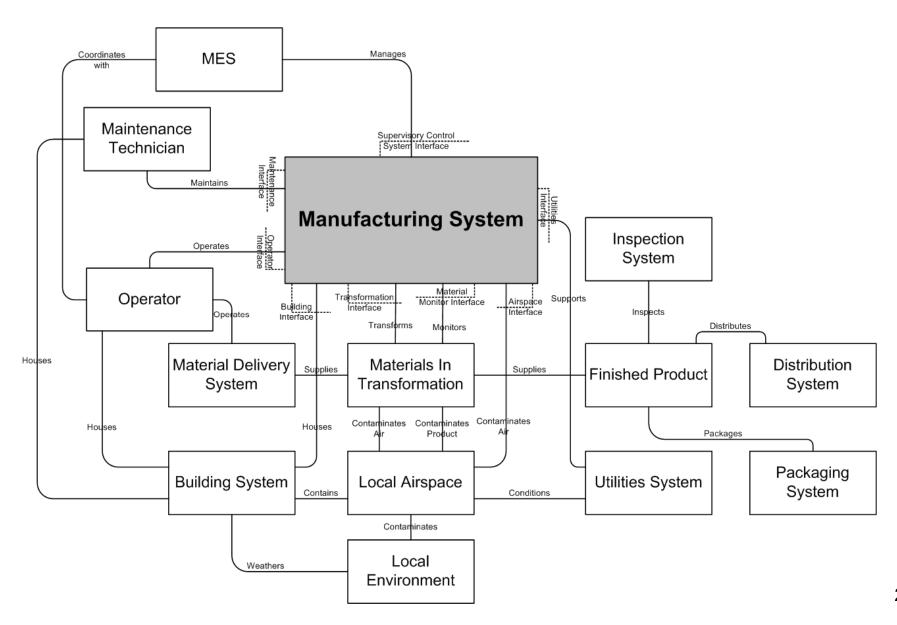

Domain model for Oil Filter System

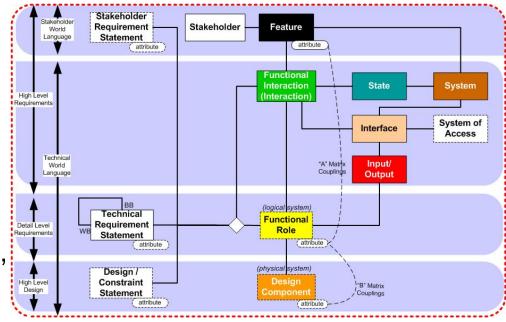

Domain model for Manufacturing System (of Oil Filter)

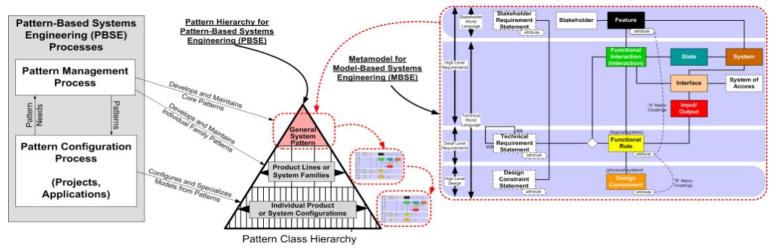

Patterns Demand Strongest Underlying Models

- The S*Metamodel describes the <u>smallest</u> set of ideas necessary to model a system for purposes of engineering or science:
 - Most of them familiar to modelers, and all of them basic to the training of engineers and scientists—but not always found in their system models.
 - A metamodel is a model of other models;
 - Sets forth underlying concepts of Requirements, Designs, Failures, Trade-offs, etc. (not modeling language syntax)
- The resulting S*Models may be expressed in SysML or other modeling languages, and constructed / reside in numerous commercial tools and information systems.
- Has been applied to SE in aerospace, transportation, medical, advanced manufacturing, communication, construction, consumer, other domains.

- The PBSE approach respects the systems engineering tradition, body of knowledge, and historical lessons, while providing a high-gain path forward.
- An S* Pattern is a configurable, re-usable S* Model. It is an extension of the idea of a <u>Platform</u> (which is a configurable, re-usable design). The Pattern includes not only the Platform, but all the extended system information (e.g., requirements, risk analysis, design trade-offs & alternatives, decision processes, etc.):

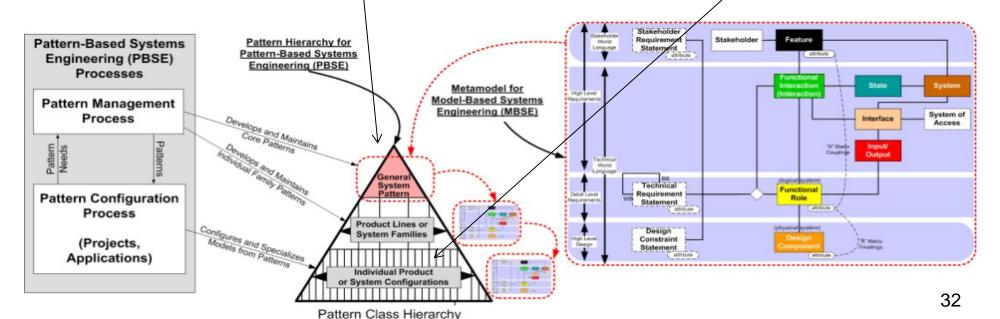

- By including the appropriate S* Metamodel concepts, these can readily be managed in (SysML or other) preferred modeling languages and tools—the ideas involved here are not specific to a modeling language or specific tool—ported to several.
- The order-of-magnitude changes have been realized because projects that use
 PBSE rapidly start from an existing Pattern, gaining the advantages of its content,
 and feed the pattern with what they learn, for future users.
- The "game changer" here is the shift from "learning to model" to "learning our (your) model", freeing many people to rapidly configure, specialize, and apply patterns to deliver value in their model-based projects.

A little more about S*Patterns

- Fixed (Pattern) Portion, Variable (Configuration) Portion, and the Configuration Process:
 - The generalized <u>S*Pattern</u> is expressed in exactly the same
 S*Metamodel classes and relationships as a specific configured <u>S*Model</u> derived from it.
 - "Configuring" a pattern means a process limited to exactly two things:
 - Populating (or de-populating) instances of classes and relationships

Setting the values of attributes (parameters)

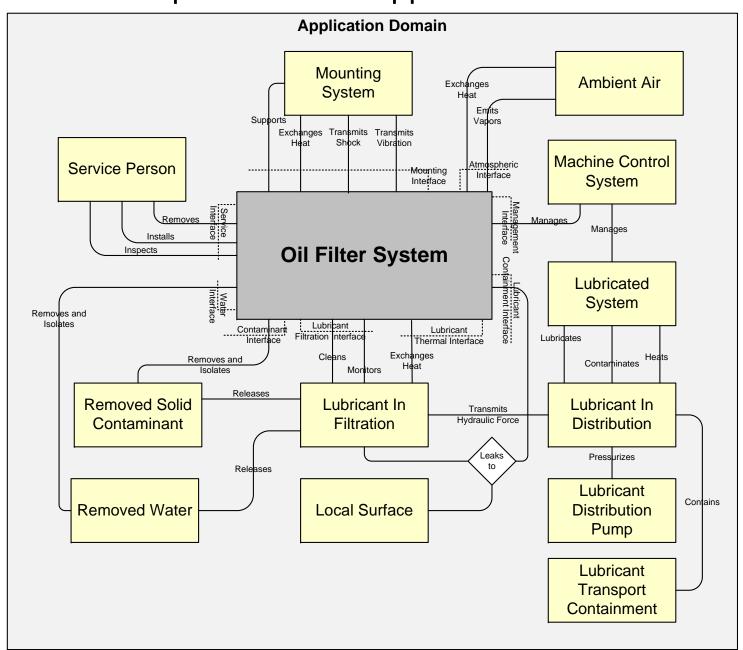

A little more about S*Patterns

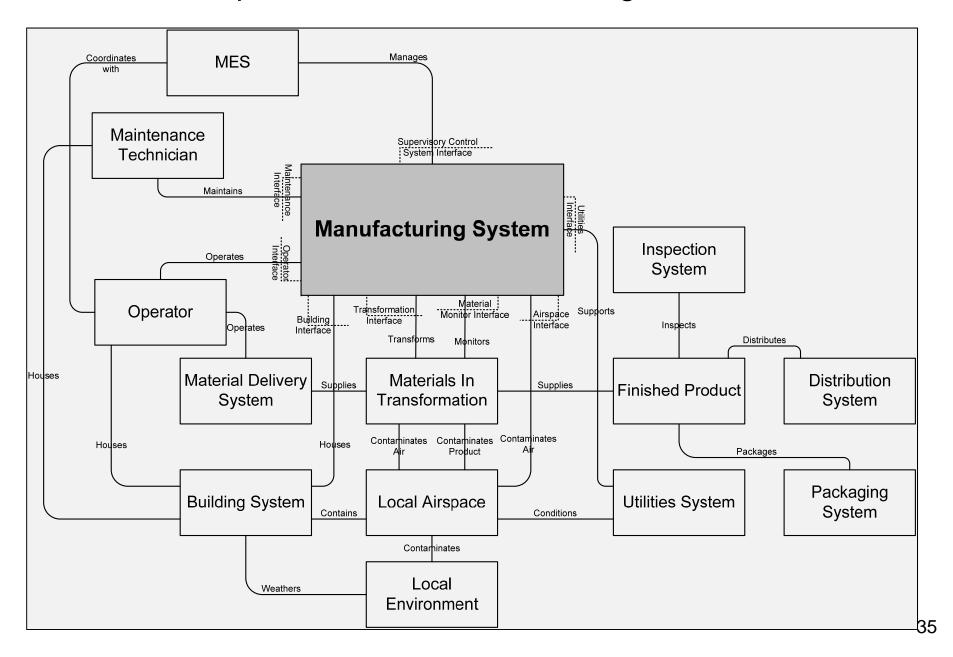

- Having an S*Pattern meeting the underlying S*Metamodel demands has some surprising positive consequences beyond basic benefits of MBSE:
 - The <u>Stakeholder Feature</u> portion of the pattern directly generates a formal Trade Space / Scoreboard for arguing, defending all decisions.
 - "Configuring" the (low dimension) <u>Stakeholder Feature</u> portion of the Pattern for a specific project or system configuration can "automatically" generate the (high dimension) configured <u>Technical Requirements</u> for that system configuration.
 - For a sufficiently built-out S*Pattern, the same applies to the System <u>Design</u> (physical architecture, allocations, attribute couplings, etc.).
 - The S*Pattern can rapidly generate very complete first draft <u>FMEA</u> tables, since S*Features lead directly to modeled <u>Effects</u>, S*Requirements lead directly to modeled Counter-Requirements (<u>functional failures</u>), S*Design Components lead directly to modeled <u>Failure Modes</u>, and combinatorial FMEA analyses of the three together may be rapidly generated by machine matching algorithm.
- All these produce much faster <u>initial drafts</u> that are much more <u>complete</u> and <u>consistent</u> than manual approaches, but which can (should) still be subject to the normal human SME review and update:
 - We are <u>not</u> suggesting turning our thinking and fate over to the model, without human judgment, expertise, etc.

Example S*Pattern Logical Architecture Model

Example S*Pattern Requirements Model -- Extract

Interaction	Role	ID	Requirement Statement
Filter Lubricant	Oil Filter System	OF-50	For a Return Lubricant stream of [Lubricant Viscosity Range] and [Lubricant Pressure Range], the Oil Filter
			shall separate Filtered Contaminant particles from the Lubricant output stream, according to the [Filter Particle
			Size Distribution Profile].
Filter Lubricant	Oil Filter System	OF-51	The Oil Filter shall operate at lubricant pressure of [Max Lubricant Pressure] with structural failure rates less
			than [Max Structural Failure Rate] over an in-service life of [Min Service Life].
Filter Lubricant	Oil Filter System	OF-52	The Oil Filter shall accommodate a Lubricant flow rate of [Lubricant Flow Rate].
Filter Lubricant	Lubricant Distribution Pump	OF-53	The Pump shall maintain oil pressure within the [Lubricant Pressure Range].
Filter Lubricant	Lubricant In Filtration	OF-54	The Lubricant in Filtration shall have viscosity within the [Lubricant Viscosity Range].
Filter Lubricant	Lubricated Machine	OF-55	The Lubricated Machine shall contribute a Contaminant Load to the lubricant, not to exceed [Lubricant
			Contaminant Load Rate].
Filter Lubricant	Lubricated Machine	OF-56	The Lubricated Machine shall not heat the lubricant above [Max Lubricant Temperature].
Inject Additive	Oil Filter System	OF-57	The Oil Filter shall inject additive of type [Additive Type] into the Lubricant flow, at a rate of [Additive
			Injection Rate] per unit of lubricant flow, over the service life of the filter element.
Remove Filter Media	Oil Filter System	OF-90	The Oil Filter System shall permit the removal of its used Filter Media.
Remove Filter Media	Oil Filter System	OF-91	The Oil Filter System filter media removal process shall allow the service person to avoid direct contact
			contamination with filtered contaminants and lubricant.
Clean Filter Media	Oil Filter System	OF-92	The Oil Filter System shall permit the cleaning of its used Filter Media, for reuse purposes, using cleaning
			solvent and method of type [Filter Media Cleaning Method and Solvent].
Clean Filter Media	Oil Filter System	OF-93	The Oil Filter System filter cleaning process shall allow the service person to avoid direct contact contamination
			with filtered contaminants and lubricant.
Insert Filter Media	Oil Filter System	OF-94	The Oil Filter System shall permit the insertion of its Filter Media, of type [Filter Media Type].
Insert Filter Media	Oil Filter System	OF-95	The Oil Filter System filter media insertion process shall allow the service person to avoid direct contact
			contamination with filtered contaminants and lubricant.
Transmit Shock & Vibration	Oil Filter System	OF-100	The system shall meet its other requirements when subject to a vibration spectrum not exceeding [Max Vibration
			Spectrum] during its in-service life.
Transmit Shock & Vibration	Oil Filter System	OF-101	The system shall meet its other requirements when subject to shock intensity and frequency not exceeding [Max
			Shock Intensity and Frequency] during its in-service life.
Monitor Filter	Oil Filter System	OF-102	The system shall provide a means of inspection of its remaining service life before requiring servicing, using
			[Filter Monitoring Method].
Prevent Vapor Leakage	Oil Filter System	OF-103	When operating within its rated lubricant pressure and temperature, at altitudes not exceeding [Max Service
			Altitude], the system shall maintain Vapor Leakage to the ambient air space below [Max Vapor Leakage Rate].
Prevent Lubricant Leakage	Oil Filter System	OF-104	When operating within its rated lubricant pressure and temperature, at altitudes not exceeding [Max Service
			Altitude], the system shall maintain Fluid Leakage to the surrounding space below [Max Fluid Leakage Rate].
Transmit Thermal Energy	Oil Filter System	OF-105	The system shall meet its other requirements while operating in external ambient air temperatures of [External
			Temperature Range] and lubricant temperatures of [Lubricant Temperature Range].
Install Filter	Oil Filter System	OF-106	The Oil Filter shall be manually installable in ten minutes or less, using only a screwdriver.
Install Filter	Oil Filter System	OF-107	The Oil Filter shall have installation instructions printed on its exterior surface, in [National Language] language.
Install Filter	Oil Filter System	OF-110	The Oil Filter shall not present sharp edge hazards to the installer during the installation process.
Install Filter	Oil Filter System	OF-111	The Oil Filter shall be clearly labeled with instructions to shut down pressurized equipment prior to installation.
Install Filter	Service Person	OF-112	The Service Person with the visual acuity and hand strength of an average 40 year old adult shall be able to
			install the Oil Filter System.
Install Filter	Service Person	OF-113	The Service Person shall be capable of reading [National Language] at the tenth grade level.

Pattern Configurations, Model Compression

- A table of configurations illustrates how patterns facilitate compression;
- Each column in the table is a compressed system representation with respect to ("modulo") the pattern;
- The compression is typically very large;
- The compression ratio tells us how much of the pattern is variable and how much fixed, across the family of potential configurations.
