

### TEAM TOP GUN: APPLYING DIGITAL THREAD ACROSS THE PRODUCT LIFECYCLE

# **INDIANA** DEFENSE NETWORK

### **Technical Interchange Meeting (TIM)**

June 9-10, 2021

# Insert Mark's introduction material

• (Suggestion: say more about the five team member organizations and their project roles, contributions)

### Our project's 4 goals for enhanced Digital Thread ecosystems:

- 1. Improved collaboration: SMM OEM
- 2. Improved learning: for workforce individuals, enterprises, region/sector
- 3. Improved delivery of needed information across life cycle "HUD"
- 4. Improved framework for standardization of Digital Thread

### described by . . .

Universal INCOSE ASELCM innovation ecosystem descriptive reference pattern

Used by INCOSE, AIAA, others, for planning & analyzing agility, digital threads & twins, ecosystems of all types

Level 0 View, INCOSE ASELCM Pattern

**Our project**: System product (hydraulic drive) exploded physical architecture-a type of <u>model</u>.

Behavior (function), value, and other types of system product (SysML) models

O-Ring seal

- The general collaboration semantic framework we illustrate is based on:
  - the SMM and the OEM each making use of their own internal <u>learned but explicit</u> modelbased patterns (<u>recurring configurable models</u>, a newer practice to them),
  - which are also tied to their traditional artifacts (not new practice to them).
- In our simple simulated pilot, these model-based patterns are the <u>parametric</u> <u>models</u> for the <u>OEM Product Performance</u> and <u>SMM Production Performance</u>:
  - Illustrating differential games (both cooperating and non-cooperating cases).
  - An advanced project would add discrete modular combinatorial games, for full modularity.

# Optimized collaboration, enabled by explicit, model-based patterns—may be private to each enterprise

#### Improve group learning: Teams, enterprises, ecosystems, region Differential games • Discrete modular games Manufacturing S\*Pattern Hierarchy for Pattern-Based Systems Stakeholder Pattern Stake lder Feature World Engineering (PBSE) Requirement anguage Statement **Reusable General** S\*Metamodel for Model-Based Systems Apply Model Learn 4 nteractio State Systen Engineering (MBSE) High Leve (Interactio **Specific Configured** Genera System of System Model Everv S\*Metaclass sho Access Pattern mbedded in both a tainment hierarchy and a Improve Configure, Specialize Input/ Coupling World Pattern Product Lines or Output Pattern System Families -- (attribute) **Machining Process Capability Check Against Pattern** (logical system I-O Transf Technical Detail Leve Requiremen unctiona Requirement Role ·\_\_\_=== Statement ndividual Product (attribute) S Coupling vstem Configurations 14.2. #### Purchase Order

After over price comparison process we will create a Parchase Order for qualified windor quotation. Parchase order to a legal document that to created by Purchasing department will break the purchase order with reference or quotation number 600000000, and will send it to vender with required national, quantity and potness for delivery and delivery care.

To Grasse Puschase Order T-Code: ME21N-Crasse, ME23N-Change, ME23-Okplay

## Improved framework for standardization of Digital Thread

- There are relevant standards for limited aspects of the Digital Thread (References).
  - However, the state of the art in digital models is evolving rapidly.
- This project illustrates additional approaches that can strengthen semantic interoperability:
  - The Model Characterization Pattern (MCP) provides a universal, configurable "model wrapper" used to plan, label, use, exchange digital models of all types—MBSE, FEA, CFD, Machine Learning (e.g., BNN), etc.
- Consistency Management as a paradigm for engineering and life cycle management across the Digital Thread:
  - Leading to wrapper-based Consistency Signature support for Decision-Making.
- Digital Thread Items Tracker for this project illustrates overview of multiple Model Wrappers across Digital Thread.
- Open versus closed standards: fenced in by slow changing standards, versus dynamically evolving wrappers.
- Configurable (SysML) ASELCM Pattern provides scalable approach applicable to planning, managing complex ecosystems, products, and services.
  - In use by INCOSE, AIAA, enterprises for analyzing System 2, 3 ecosystems, Digital Threads, Digital Twins.
- A second Digital Thread: Planning and managing System 2, including Digital Thread 1.
- S3 forever—not just one time speed up

# Insert Mark's wrap-up material

Suggestion:

- Status of current and remaining work
- Survey of stakeholders
- Plans for education and progress modules (S3) from June 1 team meeting
